First the hardware

Atari Falcon 32MHZ 4MEG 4.04 with hard drive etc
Atari 4MEG STe with Toplink interrace and 16mhz accelerator

The provider

Uk Online (PPP only)

Previous efforts have been hopeless mainly because half way though I realised the software didn't have PPP compatibility and then there was Oasis which fared no better. However I believe Sting does provide PPP which I have downloaded and I can make use of an old Cab version.

But before I start on the wrong foot again is there any where there is a step by step guide or email addresses of people who might be able to help.

What is the best software toI use?

Please note I'm not after a commercial solution. I'm using a PC at the moment and would stick with that in preference to coughing up money but would really like to get my Ataris on the net

I rried installing HSModem before and while I did install it I was never sure if I had done so completely correctly.

Any advice and info appreciatted.

Hi Martin,

first of, make sure you get the latest HSModem bunch (version 7 I believe), then get DRVIN, MFP and SCC in that order in your Autofolder. Have no clues as to special Falcon related stuff, but that should be in the docs anyway.

Then, I would opt for Sting (up to v. 1.15, but beware, it may be necessary to replace TCP.STX by an older version in case you experience slow speeds). Sting's OK for PPP too. Should be LAST in the autofolder.

Other options are PPP-Connect (commercial, comes with the CAB 2.5 upwards packages) or the Draconis stack (which up to now is still free for evaluation but I couldn't get it running from MagiC. TOS was OK. Don't know how compatible it is for clients based on STIK/Sting).

As a browser I'd opt for CAB (1.5 latest freeware) but the commercial 2.5, 2.6 and now 2.7 have more options and are faster. Demo's available, but then no online-browsing. Note that for CAB-on-Sting you need CAB.OVL from Dan Ackerman, CAB-on-PPPConnect uses CAB.OVL from the package).
Other browsers: Adamas (part of the Draconis stuff) but I had nightmare experiences with it, Wensuite (commercial but simply a laugh; it's a No-GO).

For E-mail, FTP, IRC, Telnetting there is a broad variety of clients available. Nice option is Newsie, which does Newsgroups (on- and offline), FTP, E-mail and basic webbrowsing (no graphics).

Oasis was abandoned and from what I gathered was messy too. No regrets!

Best thing is to check with UK-online users for a correct Sting setup.

Good luck!

Hi anybody,

I try to create a free multilingual html manual.

Looking for people how was can translate one technical ascII
text with a lenght of 14.3KB into the following leanguages:

french
svensk
italian
espana

Payment: nothing, results are free
Release: free, if the developer like it

Give me your replay.

Regards, Robert

Some years ago I purchased TOS 2.06 and the ICD AdSCSI+ kit for my 520 STe.

Soon after, the STe died (or maybe I killed it?) but I managed to pick up a second hand 1040 STe (Amazing how they look the same on the inside ;-) but didn't upgrade the TOS again since I mainly use it for MIDI work and didn't really miss much of the 2.06 features.

Last week I got around to upgrading the TOS to 2.06 again on the 1040 STe - it must be about 3 years after I got it.

Is this still the latest version of TOS for the STe or is there something more recent?

Also, is there a web or FTP site somewhere that has updated utilities
for the AdSCSI Plus?

thanks

Steve

>there are on the board, or the location of the proper one, but you can

It should be marked VR602 and is connected via a 330k resistor to pin 7
of the TDA11700 chip.

>The horizontal size is controlled by an adjustable coil, and there's
>only one so you can't mistake it.

Actually there are two; you want L702, which is connected to pin 3 of
the scan coil plug, with its other end going to the second coil that
adjusts horizontal linearity (it has a resistor R722 connected across
it) - don't touch that unless correction is needed!

> It requires a special tool to turn
>the iron slug inside the coil and adjust the width of the picture.
>The tool is plastic (a metal tool will distort the picture) and has a
>small hexagonal head on it. You CAN use a small metal screwdriver to
>turn the slug a little at a time, then remove the screwdriver to see
>what the results are. (We're talking SMALL here, like the largest size
>of a jeweler's screwdriver set).

And don't keep it in the core for more than a second or two at a time,
otherwise it gets *very* hot from induced eddy-currents (speaking from
bitter experience!). A bit of plastic knitting needle with the end filed
to a screwdriver shape is far better.
>
>If you're not sure what you're doing, don't do this! Find someone who

Well, it did turn out to be a joystick problem. Somehow or other the
joystick's switch had been moved from the "Atari" position. It's now
been set back to Atari and all is OK.
```

Many thanks for the help given.

I suggest that you use STinG. It's fairly easy to setup and offers PPP. The hardest part is seting up the Dial script that STinG uses to logon on to your service provider.

As I use Zetnet I cannot help you with your dial script. Perhaps the best thing to do would be to telephone the support desk of UK Online, explain that you wish to use your Atari to access the Internet and ask them what their logon process is.

Hope this helps.

Regards,

Ben Hills.

You cannot. Linux and NetBSD require at least a TT or a Falcon.

Your best bet is to install MiNTos, using the KGMD package or
the english version KEMD_R2. See http://kellis.atari.org for
more info about it.

The released version of 68K linux requires a 68030 and an FPU. The STE
has neither of these.

It appears there might be a version compiled for a 68000, but I don't
know where.

You might rather go for MiNT, which is very Unix-like, but also TOS
compatible. There are many unix utilities that have been ported to MiNT.

Cheers,
Nick

Yes, Check out the Quick FAQ, which has a step by step guide:

http://quickfaq.atari.org

or this page which should also have what you need:

http://www.acay.com.au/~stevebj/sting.txt

> What is the best software toI use?
>

HSModem for the serial port
STinG for the TCP/IP connection
CAB + CAB.OVL for the Web
Newsie for mail and news
Aftp for FTP
etc...

You could also go the MiNTNet route, but it's a bit more fiddly, but you'll have full multitasking too.

>
> I rried installing HSModem before and while I did install it
> I was never sure if I had done so completely correctly.

For the STE, just stick the DRVIN.PRG in your AUTO folder, and then MFP.PRG (in that order). For the Falcon, it's DRVIN.PRG and then SCC.PRG. That's it.

Cheers,
Nick

There is Linux for the Atart ST - but it's not yet complete. You can
check out it's progress at:

http://www.esat.kuleuven.ac.be/~pcoene/index.html

Gav.

I had a look inside the monitor tonight. I think I will need to go and buy a
plastic
adjustment tool. At least all of the adjustment pots are marked but buried DEEP
amongst all that high voltage wiring. I think I want a loooooong plastic tool.

I don't know anything about PLIP on Amiga. However, it should be
possible to design some simple hardware and/or use some additional
lines on the Atari to get Atari<->Linux-PLIP working. It would most
likely need a new PLIP-implementation on the Atari though.

Would 30DM + postage expenses be too much for PCB & programmed GAL ?

There is another (more expensive option)- you can wait a bit for me to complete turbo card for ST.
There should be 68EC000FU20 working on 64 MHz, IDE interface and 8 Mb extra RAM (in addition to
4Mb that you can solder in the standard way). Extra RAM is accessible directly to the CPU on card, so there
should be no waitstates, while first 4 megs still work on the standard speed, so CPU would loose some of its edge
while accessing that RAM. I think that I have quite neat way around this too...
Expected speedup is at least 500%, no matter what you do with it (graphics, heavy math etc.).
Expected price for that card is 300DM, and I haven't decided yet regarding the kit option...

Regards,

Branko

OK - there's little point in me extending the VME port out then as I have no other
VME
devices to add on :-)

>>3 - How can I modify my serial port to give more "standard" rates?

```

This doesn't change the rates that my modem will accept though, I can only get up to 38400
with my 33k6 :-(

I have the latest motherboard which has a 32MHz CPU soldered directly, I figured that
there would be some trouble with this idea and maybe the hassle and expense are not
worth the bother. A Milan might be easier :)

Anybody used digital postcards with an Atari?
Some friends have sent us one using :-
http:/www.all-yours.net/postcard/dp.html
but when we go on to pick it up, we always end up in the problem
page. We're using CAB v1.5/STiK v1.12 on a TOS2.06 4Mb STe.
"all-yours.net" said they'd never heard of CAB, and did it support
FORMS and POST requests. Haven't a clue! Anyone got any ideas?

Gaz+Liz.

With a lot of planning and forethought, you might fit a 2.5" and a
3.5" inside a stock case with that adapter. You will definetly have to
find some "custom" IDE cable to reduce the length of the dual 3.5"
cable that is included (unless you really fold the heck out of the one
provided).

STOP STOP STOP......

Please no more " I broke my Falcon post ".

That is one of the internal expansion connectors. Please DO NOT
connect your SCSI to this connector.

The best way is no not to try it. C-LAB hacked a connection by removing the SCSI termination on the motherboard and soldering a half assed cable to it and terminating the drive. The external connector can still be used, last device terminated, as usual.

If your not using Cubase Audio, get a 2.5" IDE drive and be happy with a working Falcon.

There are, or were, a few units which do this. However I am currently working on a low-cost interface for AT keyboards and serial mice in the one unit. It will include support for features such as the mouse wheel and the extra keys on newer keyboards.

With any luck it will be available before the end of the year. I have prototypes working now, but I still have to implement some of the wierd IKBD features and some other stuff. I will announce it in comp.sys.atari.st when it is available. It should cost less than twice as much as my mouse interface (see my WWW page).

Also, I have created a mailing list where I will announce progress on my Atari hardware projects. Send me an email if you would like to be included.

: Anyone seen any information regarding a hack to put an IDE device on an
: Atari ST?

I have completed an IDE-Interface and TOS Upgrade design for the Atari ST. I have not yet announced it since I've been a bit busy.

It solders onto the CPU in the ST (or you can solder a socket on and plug the board into it) and fits inside the case of (hopefully!) any ST, although this can mean cutting the shielding. The board includes sockets for TOS version 2.06 (or another version) and has both standard and 2.5" IDE connectors. With a 2.5" drive, you can fit the whole assembly, including the drive, inside the case. Being compatible with the Falcon IDE interface, it works with hard drives and CD-ROM drives via a standard driver. Up to two IDE devices can be connected to the interface.

It will retail for no more than 150 New Zealand dollars, 50 UK pounds or 80 US dollars (dealer rates for small volumes are significantly lower).

Anderon skrev i meddelandet <70btip$989@sjx-ixn5.ix.netcom.com>...

:It has sound. Sound which could be improved, and could be (very easily).
:It has enough speed, could use a little more. Most of the ST's speed comes
:from it's use of multiple processors - this could be enhanced to a degree.
:Networking? WHY? Use a PC for that. Memory - it's got memory. Getting it
:to map out more than 4 megs is not a tough job at all.

The ST has only one real processor, the MC68000. The keyboard processor is
the other one, but can't be used for other purposes than "keyboarding".

I can see that you're not interested in making an ST replica, but some kind
of new machine with the spirit of the ST in it? Like the Milan, Medusa, Hades
and others. Networking is in my opinion an absolute must, and cheap to
realize. Imagine a network of, say eight, ST:s. This means you could sit down
and develop a new Operating System which would treat the whole network as
one single unit. Which would mean that the processing power of these eight
could be combined (added) to perform magic...

Just to name one possible use of a network...

:Why emulate the circuits? Why not use the faster replacement chips that
:have come out, and utilize their abilities to extend the ST even further?

It's a matter of software driver routines and compatibility. Even if you
replaced every circuit with a better one you'd have to have some kind of
compatibility backwards. What if programs don't work?

Take the FDC for instance. If you start using another one than the WD1772,
you'd probably need to write your own formatting software for it.

It's a big job to do what you propose and I wish you luck. But I'd start with a
smaller project first, maybe developing a graphics card or so?

I'm not sure yet...the url (http://www.wizztronics.com),
doesn't go into details on where things go...they do claim
to offer a kit to mount 2 3.5", or 1 2.5" and 1 3.5" IDE
drive solder free...all brackets/cables, etc included. Mine
should be in any day now, and I'll post about it if you'd like.

I do use CAF...
I have an extra 3.5" SCSI mech, but no proper casing for it.
Just looking into the internal option as it would be rather
convienent for a more portable machine.

Thanks none the less...
I become more inclined to take your advice.

Imitation offers an interesting looking disk drive on a wide
variety of platforms. They accept conventional 3.5" floppy
media, and a 120meg media of their own. This would be a neat
drive to replace the stock 1.44 floppy of the Falcon!

Any chance one might work?
See the url, http://www.superdrive.com

Serial 2 can give up to 115200 by standard.  Just make sure you
select Serial2, by correctly setting SCC.PRG from HS-Modem.
Otherwise, it defaults to LAN port and Serial2 will be dead.

Pretty sure. Perhaps it would be wise to visit Tom's hardwarepage first
(http://www.tomshardware.com)

>I mean, low-res VGA on a PC (same as ST lo-res) only refreshes the
>monitor at 70hz, which I make to be 14khz, BELOW the 15.625khz that the

Actually, bog-standard VGA resolution = 640x480 pixels x 4-bit color depth
at 31kHz horizontally, 60Hz vertically
Don't know about low res VGA (320x240 x 8-bit color depth).

>ST supposedly requires - but not a multiple of the 31khz you claim as
>the minimum for PC monitors (which doesnt seem to fit in with any
>resolution/refresh rate combo I know of). The ST could overscan to

>60hz, putting it a bit ahead of VGA.. :) :)
The ST uses 15kHz horizontally in low-res and med-res, 35kHz or 31kHz (not
sure about this)
in hi-res. Low & med: 50 or 60Hz vertical (switchable), High-res: 70~72Hz
vertical

>Care to fill me in? I am unafraid to be shown as someone ignorant of the
>truth.. some diagrams telling me how to fix my phillips CM8833 without

I have a CM8833 as well (the old type I) and it has the following I/O as
standard:
-a 21-pin Euro/SCART (in the Americas often called A/V) adapter
(the wedge-shaped connector): there are standard leads to connect STE's to
them
readily available (oh yes: WERE available) from retailers throughout
Europe - I might
be able to open one up and figure out some pin-outs

This is the main connector I use to hook the CM8833 up to any Atari (wether
an ST
or 8-bit machine or even a Jaguar - excellent picture - or Amiga or C64

or...).

Philips calls this the "RGB" connector in the manual.
The CM8833 has a standard line frequency of 15kHz max hor. and a standard
raster frequency 60Hz max (50Hz min) vertical.
It can be switched ino two modes of which I do not yet completely understand
the difference. My guess is that one is actually a
composite type signal mode and the other is a truly seperated R/G/B/ mode.

-a 5-pin DIN TTL-level connector. This is a digital connector for which
Philips could provide a special cable with DIN on one end and CGA-pinouts on
the other. I use this connector primarily to hook my CM8833 up to a PC/XT
system with a CGA card.

-a pair of RCA / "Tulip" jackets for composite video: may be used for any
composite video signal, including some rare CGA cards and some PCjr systems.

>killing myself with residual current (or spending more than the monitor
>is worth) would be nice as well.
>
>(oh yeah -- the CM8833 was quoted as being an "Atari ST/Commodore
>Amiga/PC CGA monitor" in an advert in the same magazine. [I can send a
>scan if needed] -- and this monitor can display CGA, so it must have at
>least one display mode in common)

Yes - but bare in mind that VGA displays only SIMULATE CGA, MDA, HGC and EGA
modes in terms of resolution x colors, not in frequencies (!)
Some hardcoded PC/XT games do not look good or work very well at all in CGA
resolution
on most VGA displays. All this depends largely on flexibility of the display
adapter.
Kind of standard ST-low on a Falcon with a VGA VDU but without the ability
to adapt to a RGB VDU.

If your drive is a 3.5" unit, you would need to put the ST+drive in a tower or use some external case, because a 3.5" drive requires more power than an ST PSU can provide. A 2.5" drive is ok though.

Cheers,
Nick

There are several adapters available in the UK. Just like the IDE
adapter, this sort of stuff requires PAL or GAL components, so they are
not as accessible to the average user.

Cheers,
Nick

There was some discussion about these a while back. We came to the conclusion, that they should work just as an IDE removeable drive. You would probably need HD Driver, and it would probably not work as a standard floppy drive.

Cheers,
Nick

It will work, but you can't *replace* the floppy with it. But if you have a LS-diskette with a harddisk-driver installed you can boot from it, and with HD-Driver you can even set it to drive A. So unless you need to boot some games directly from floppy you can actually just remove the old floppy and install a LS-drive instead :-)

HI
I'm getting back to my STe and I'm trying to find the cheapest/best way to
get a monitor and a hard drive for it, suggestions please.
I'd be happy to try simple hardware mods but nothing too complex

I'm in the UK so British solutions, if there are any, would be preferable

The IDE version is interesting...the price at least...it's pretty cheap :)

Wonder what it'd take to allow it to format, and read/write to standard
1.44 media? Even if it wouldn't boot floppys as the Falcon does, it'd
be nice to be able to install that software upgrade that just came in on
floppy disk...well...just to be able to share two drives in very one very
cramped space of the Falcon.

HD-Driver 7.5x already supports those, as far as I remember.

Monitor:
Cheapest: plug it into your TV
Best: Get a 19" multisync monitor to switch between all three screen resolutions.

Hard disk:
Cheapest: Find an old Megafile20 at Cash Converters
Best: Get a Link'97 and a RAID 6 disk array.

Reasonable solutions are made of compromises. The main factor is what is actually available and affordable.

Check out the Quick FAQ, and dealers web pages (Titan, Systems Solutions, The Upgrade Shop) look around, read a few magazines and make yourself an idea of what you really need. There's lots of stuff out there.

Cheers,
Nick

Well, you can get stuff for intel machines for either nothing or next to it, so I guess people expect that Atari is similar.

I've just completed a 486DX2-66 system with 8 meg fast page memory and 1 meg video card with 420 meg SCSI disk, SCSI tape drive, 8x CD ROM for zero cost. The oldest component that I have used is from 1993.

You and I both know that this is only possible because the intel technology becomes obsolete very quickly, whereas the Atari technology from 8 years ago still works just as well now as it did then.

My Atari was made in 1990, so given the above, I would not expect to pay more than peanuts for anything for it - such as the free 40meg quantum SCSI drive that I picked up for it recently.

If something is technologically "old", then people expect it to be cheap. If only I could pick up Atari hardware as cheaply and easily as the intel crap!

regards

Steve

The position of the 8 sitches is read-out by boot-up.
Only relevant one for TOS is nr. 7 that makes the system aware of an
1,4 Mb floppydrive.
The destop its 'format disk' should than give you a choice between
normal 740 kb and 1.4 Mb.

As told above.

But be sure: the floppy drive must be configurated as a standard IBM-
PC drive (see jumpers!)

A standard 1.44Mb will work without any modifications, but the problem is probably that your TT is so old that it doesn't have an Ajax floppycontroller. It works very well in my TT (I have a old 1772 controller and a 1.44Mb drive), but I can't say how yours will cope.

Yes, HDDRIVER supports these drives. (Other hard disk drivers don't.) I
have such a driver connected to my Falcon as IDE slave. Nevertheless
replacing the floppy is no good idea. Note that the LS-120 is an ATAPI
device, i. e. if for some reason you can't boot the hard disk driver you
can't use the LS-120 at all. Even when floppy disks are inserted the
LS-120 behaves like any other removable media drive, i. e. a working
hard disk driver is required.

68881 or 68882. Prefer the latter, the higher the speed, the better.

Cheers,
Nick

Actually, my STE has one. It's happily running a 1.44 drive at the moment. Someone posted a list of AJAX chip part numbers once, and I remember checking that I had one. Has anyone got a copy of this list floating around ? I'd like to add it to the Quick FAQ.

What about the famous faulty DMA chips ? Which part numbers were concerned ?

Cheers,
Nick

Hey Brad at Best Electronics has the AJAX chips listed in his
catalog for $40.00ea. Also not all the Mega STEs have the AJAX
xhip in them from the factory.

-FYI-

I suppose one could purchase the C-Lab Mk.X casing and fit an
LS-120 besides the normal floppy, installing it as drive B.
(there is a blank floppy cover besides drive A, AFAIK)

I understand that, from a hardware point of view; just about any 386 with the cheapest graphics card does at least 640x480 at 256 colors and there are zillions of ISA or PCI cards nearly free.

However, I find it appalling that people constantly show up on IRC #atari asking "where are the Atari warez sites?"

People apparently think that if it's not a Pentium 600 MHz with Windows 99, then they should not pay for it.

Now, THAT is infuriating, especiually knowing that wintel is crap.

Sounds very good to me. I'm interested. The only problem I see is to get a TOS
for this hardware, especially bios and xbios. Moreover, I fill more and more
limitation in single tos : Mint is fine.
If you go forward, I'm your man !

Eric

I am after the cover disk for Amiga & ST Format issue 4. NOT Amiga Format or

ST Format, but Amiga/ST Format the one before they split into two mags.

I'm only after the ST contents.

Thanks

The WD1772 is the FDC. It was also used in the STFs and STFMs until Atari made/commissioned the Ajax chip, which is what your STE has.

<snipped>

>Sounds like you've found one of the TOS chips?

On my STE, the FDC is marked as C302096-001A. The TOS ROMs are C301165-002A and C301166-002A.

>The FDC in the STE is situated between the ACSI (DMA) and the printer

>VLSI something.

That's the place. To verify it, look for U301 marked on the board next to the chip.

I would have to disagree with the bit that says 'won't be as
good as a proper Atari monochrome screen' Nowadays even

colour tubes can match the Atari screen for resolution and with modern framing controls you can get a perfect picture. Besides some Atari mono screens were poorly set up.

Also I believe there is a circuit that can convert TV sync signals into a PC monitor compatible type. Its a fairly ambitious project but for real enthusiasts it can be done and presumably once made it could be simply adapted to take ST signals instead of other RGB sources like consoles, Amigas etc.

However the best and easiest solution is a multisync. I use a Microvitec 14" Autoscan and it works very well in all the ST modes (except you can't eliminate all the side borders on ST low/medium res. There's still a 1cm and a bit showing each side).

Right, not to sound negitive, but soldering fifty wires anywhere is a task:). The best alternative, if you can find the room, is to loop a short SCSI II cable from the external connector into a dual centronics SCSI connector fitted at the back of you machine. You might be able to cut a little of the case and fit them side by side, connecting the internal SCSI into the chain. At least that doesn't require soldering:). You might even find a dual SCSI II setup, which would save a lot of space. I think that JAMECO has some SCSI II to 50 pin ribbon cable connectors for PC's that would do the trick. Umm, that gives me an idea........:). www.jameco.com

Even if you did solder to the bottom of the SCSI connector, you would have to loop the cable from under the board around to the top. You would probably have to cut some shielding to to this as the board sits pretty close in all areas. I have one machine with cut shielding, and all I can say is once it's done......

The C-LAB idea wasn't bad, but wasn't applied properly. They really should have somehow installed a standard connector and ribbon cable on the motherboard where the termination resistors were. It would have been a much cleaner and user friendly setup. To copy the way they did it would requrire quite a bit of soldering/desoldering skill and an absolute knowledge of which wire went where. All 50 of em.

Does anyone know how to load TOS from a floppy disk? I have an Atari 520STM
(external floppy and power supply) with a 2mb memory upgrade and TOS 1.0 and
I would like to see if there is any improvement loading a later TOS. I have
downloaded a few TOS images from the Little Green Desktop site and would
like to try some out. Any ideas anyone ? Thanks John McDermott.

No, it's a internal kit. It's only for STE's though. C't published a
DIY-project for the (Mega) ST five years ago, eMedia still has the
GAL, PCB and building-instructions (German). I have one in my Mega ST,
it works great. Completely Falcon/ST-Book compatible, so all current
harddisk-drivers work.

I think it'd be a neat project. But if you did such a thing, it would be hard to make it compatible right down to the hardware level since Motorola has discontinued some chips like the MFP 68901 (which is a shame, seems they don't have any equivalent at all!). I don't know what other chips are still easy to get (sound chips, ACIAs, etc.)

I'm starting a simple (probably 68k-based) design with a friend for a robot project, but I'm trying to design the expansion buses so I can add computer-type peripherals..and the same idea popped into my head.

I checked on the Motorola site.. they don't make many bare-bones 68000 models any more, just the 68EC000.

I have never been able to get a Quantim to work with any ST or
the Mega STe. I can get them to run fine on the Falcon and the
TT. This only after giving the computer a SCSI ID of 7 using HD
Driver 7.51

The Fireball-drives need SCSI-arbitration, which means that you need a Link97 and HD-Driver to use it with your Mega STE.

I think I've been to his page. But, hardware hacks are just the beginning.
I need full schematics. I've got just about every english hardware hack for
the Atari St that I could find, just for reverse engineering information.

Well, that's one little obstacle. I would like to extend the design, and
even rework parts to be more efficient, or to take advantage of newer
technologies.

I have access to an older, broken ST, and perhaps I could buy some more (the
price would have to be right). I could strip the chips off of those.

Right this minute, I'm in the process of "re"-building an Atari 130XE. I
wonder if these things have any marketable value...hmmm...

Hello,

- new list of CENTurbo II compatibility softs. Thanks for user
to send me your test.

- new versions of CENTscreen (3.3.1) and VIDEOMODE (1.1.0)
on the site. The goal of this version is to correct a bug with nvdi
which didn't change resolution if the boot and the desktop have
the same colour depth.

- the PATCHCT2.ZIP (on CENTURBO II page) contain a modify
SCC.PRG (HSMODEM) to run correctly on CT2. The original
think that SCC is on 14MHz master clock instead of 8MHz.

There is a WWW site somewhere with reasonable scans of the schematics. Otherwise you can buy them from Best Electronics (or perhaps another Atari dealer).

And yes I imagine it wouldn't be difficult to make an exact copy of the ST. What would be more interesting is doing away with all the custom chips, and then upgrading everything a bit. After getting it working in its usual form, you could add an 030 or so, and some better graphics hardware, things like IDE and SCSI interfaces, SCC, and all the other features that it would be nice to have.

This is impossible because Quantum Fireball drives expect initiator identification, i. e. they expect that your computer has an SCSI ID of its own. Initiator identification for TT and Falcon can be supplied by the hard disk driver. For the ST/STE, however, a LINK97 by WB Systemtechnik is required. Other link adapters except those from WB won't work, i. e. the drive is not recognized.

> Do you think, can any driver (HDDRIVER?) solve this problem?

No, not for the ST/STE. Only for TT and Falcon.

One could conceivably make an ST without any Modem1, using a single
ESCC like in the Falcon. Sortof like a MEGA-STE without Modem1. As
long as you properly identify the devices in the BIOS, it should still
work just fine.

I had this same problem once. I tore the keyboard apart, put in a new keyboard, replaced the chip. I eventually found out that my joystick had gone bad. It was stuck in auto-fire. I unplugged the joystick and everything was ok. More recently my trackball started screwing up the keyboard. It has something to do with the holes in the mouse connector getting stretched and shoting something.

Ayway, try rebooting without a mouse or joystick. Use the <alt> and arrow keys to move around. <insert> gives you a mouse click.

How about basing the whole thing on the newer Motorola MC68360.
It has a 32 bit CPU core, but should be software compatible with the old
MC6800. Runs up to 33 MHz & has built in DRAM controller, several serial
ports, one parallel port, 4 timers, interrupt handling.

That should help reduce the chip count somewhat.
Of course, you would have to "adapt" the bios.

Nice project for somebody with time.

> The first time, I got the modem to dial and do the handshaking, but I couldn't send or receive anything...
> The second try (some weeks later) I couldn't even get it to dial ...so then I gave up! :-)

Not a good move. LAN uses different protocols and different voltages to rs232 (rs232 = +-10 volts, lan = +5 volts).

However, as u thought, it is possible to create either another serial port (modem 1) which will give u an st compatable (19200) serial port - instructions for this are in the hsmodem docs (buried somewhere in the middle I'm afraid) - which I have got working and use for direct serial coms (null modem cable) or there is a new adapter that allows u to plug a pc mouse into the mouse port of the Falcon. I don't know who is selling the adaptor but I've been told it's about 20ukp (a little steep but much better than cutting up the motherboard if u can't do electronics).

Up to u really.

Both solutions work well.

MCS68901 is a problematic one, but I think that SGS or Toshiba makes CMOS one which is also twice faster...ACIA's are stupid and so probably easilly done in FPGA etc. Sound chip is probably more problematic, since it is out of production, but I think it should be possible to emulate with a microcontroller with maybe a little extra hardware...
Same goes for FDC.

>   I'm starting a simple (probably 68k-based) design with a friend for

I have made nice little expansion bus for 68000, 68010 and related animals, it was meant to be QL-compatible beast but I have had never finished it. I think that it would carry ST-compatible machine without any problems.

>   I checked on the Motorola site.. they don't make many bare-bones
> 68000 models any more, just the 68EC000.
>

Two observations:1. They do make 68HC000, which is the same as 68000 except that HC is much cooler and more overclockable
2. What's wrong with EC ? It's plain old 68000 in cool CMOS without built-in support for old 6800-type support for those old peripherals, but otherwise it's a reall bullet. I have mine EC which is rated 20 MHz working at 66 MHz ! SEC is even cheaper and it works off now popular 3.3V at maximum freq.

Regards,

Branko

I downloaded a couple of MSA files into my HD. I can't delete them! They are hogging over 3 MB of disk space and all it says when I try to delete is: Cannot delete. I can't even rename them. I've some other files with the same problem. How do I delete them please? I have just a 44Meg SCSI on my TT030 and I need all the space I can get. It's filled to the brim now. Somebody please....

Joshua.

I'd like to install a SCSI drive INTERNALY for my stock Falcon 030. Earlier postings lead me to understand I must solder a flat ribbon cable to the underside of the mini SCSI II connector on the motherboard. So what I need to know next is this:

Wizztronics now has a kit for mounting two 3.5" IDE devices inside the Falcon, and I've ordered it. So that takes care of the mounting for the SCSI mech (my 2.5" IDE has long died).

I finally opened the case for a look inside and found a 50 pin connector just in front of the power supply that appears to be terminated. Is this not for internal SCSI? If not, what is it?

What is the proper pin order of this MINI SCSI II type connector? I'm not even sure where pin one is, let alone what what order the rows are in (there are three rows) (assumeing that connector is indeed NOT scsi, and I have to preceed with the mod.

If I do this mod, there is confusion remaining over the termination. I'm thinking the proper thing would be to keep the internal SCSI device UNTERMINATED and use an external termination block; hence, making it possible to still use external devices on the chain. Currently I simply keep termination disabled on all of my SCSI devices (external) and use a block at the very end of the chain. Is my thinking correct here, or should I terminate any internal device in addition to the end of the external chain? This seems quite sensable with only one internal device, but if I add a second internal SCSI device, wouldn't it have to be terminated, thus making the external SCSI connector unuseable? Oh heck, I'm confused :/

Okay...in a nut shell, what is the best way to add internal SCSI to a stock Falcon 030 in a stock Falcon case? I will need the external port to remain functional when the Falcon is at home, and unused when the Falcon does road work, as I still wish to use my scanner, CD-ROM, and such.

Thanks,
Brian

Is it possible to use PLIP on an Atari without installing Mint? STiK does not support it, that much I know, but does STiNG support it, or is there any other solution?

Brian Roland skrev i meddelandet <706hsu$e2n$1@supernews.com>...

:I'd like to install a SCSI drive INTERNALY for my stock
:Falcon 030

Start off by getting the F030 schematics, all pinouts are there.
Some of these schematics can be found on the Internet, but
I don't know where. Otherwise you can get them from me.

The idea is that the physical ends of a SCSI bus should be
terminated, disregarding ID numbers, internal-external etc.
In real life this requires some experimenting...

:   Okay...in a nut shell, what is the best way to add internal
:SCSI to a stock Falcon 030 in a stock Falcon case? I will need
:the external port to remain functional when the Falcon is at home,
:and unused when the Falcon does road work, as I still wish to use
:my scanner, CD-ROM, and such.

Internal SCSI drives shouldn't affect your external equipment as long
as every unit has it's own ID number. The best place to attach your
internal cable is to desolder the three caterpillar-looking resistors
P1, P2 and P3, situated very close to the SCSI connector.

Since you'll attach a HD here you don't need to worry about those
precious termination resistor being taken out. Your HD should supply
termination.

I can't help you with the signal names, since I lost my notes, but maybe
someone else can?

Good luck, Martin Graiter

Hej Andreas!

I've used a modem on the LAN port for some time now, you can come over and see for yourself. :^)
You need a MacIntosh-to-modem cable for this to succeed. Otherwise no problems!

See ya!

:Anyone built an ST from scratch? :

Atari Corporation... he-he...

Some crafty Germans have built different variations on the ST theme, I can recall IBP, Elrad and Freddie Aschwanden's Medusa. Milan is another project...

How "scratch" does it have to be?

Do you need to create the custom chips from scratch or is use of the originals OK? Believe that Ricoh actually produced most of these, maybe you can buy the drawings from them?

Forgive me for asking, but what would be the point?

Even if you succeeded, who'd buy such a machine? The ST needs vast improvements to become an interesting alternative today.

I can think of several things that would be a "must" in a modern computer,
even if it was a dear ST. Graphics, sound, speed, networking, memory, all kinds of interfaces built in, etc.

A guess would be that you'd probably be able to emulate all the circuits which are obsolete today. Maybe with DSP:s. But once again, why?

Buy a Milan and develop a nice driver for the latest graphics cards instead!

Greets, Martin

I personally would spend at least $2000 for a 300mhz G3 TOS based
Machine with true color graphics, and file format compatability
(RA/RV/MS Word etc.) In addition there would have to be hardware
level switch to allow me to boot up as a TOS 1.4 compatable machine to
play my old games.

For another $100 I would like an option to boot up in C=64 mode to
play all those old SSI games.

Imagine software optimized for an 8mhz machine running at 300mhz.

Kinda like running DOS apps on a PII:')

B.P.

I don't know if STiNG supports PLIP yet, but IIRC it was planned.
Beware that you can't connect your Atari to a PC running PLIP, because
Linux-PLIP use some control-lines that's not available on Ataris.
Perhaps it can be done with some additional hardware.

Although I can't help you with the specifics of your mod, it's worth
pointing out that the SCSI bus should be terminated at BOTH ends. Fitting an
internal SCSI drive should only entail connecting it to whatever pins you
find to be correct - leave the terminators in place on the motherboard,
disable termination on the drive and plug a terminator into the external
SCSI port when you aren't using any external devices.

This is how the C-Lab kit works, but I have to say that external units should *not* be connected to the normal SCSI-connector. I haven't been able to get this working in my Falcon, SCSI doesn't work at all unless I just terminate the external connector and connect everything to the internal bus. The solution is simple, connect a SCSI-connector (50 pin Centronics-type) at the end of the internal bus and mount it somewhere on the back of the Falcon.

>originals OK? Believe that Ricoh actually produced most of these, maybe
>you can buy the drawings from them?
>
>Forgive me for asking, but what would be the point?
>

Mostly, just to do it. I loved the ST. And having a handbuilt machine before me is a vast accomplishment. I would learn a great deal about computer architecture. I could even make up the ST's deficiencies by modifying the design.

>Even if you succeeded, who'd buy such a machine? The ST needs vast
>improvements to become an interesting alternative today.
>

Who sells that I would sell it? I'm not talking about mass-marketing such a machine, just building one for me to tinker on. Maybe two or three more, for future revisions.

The only major improvement that it would need would be a richer color depth and a USB. Speed is a concern, but if the machine is based around the 68040 or higher, it should handle most applications just fine.

>I can think of several things that would be a "must" in a modern
>computer,
>even if it was a dear ST. Graphics, sound, speed, networking, memory,
>all kinds of interfaces built in, etc.
>

It has sound. Sound which could be improved, and could be (very easily).
It has enough speed, could use a little more. Most of the ST's speed comes from it's use of multiple processors - this could be enhanced to a degree.
Networking? WHY? Use a PC for that. Memory - it's got memory. Getting it to map out more than 4 megs is not a tough job at all.

No, it doesn't need much more to do the job that it was intended to do - and that is a basic, solid platform which is largely software driven. Games,

browse the internet, whip together a document, all of these things that the
ST does now.

>A guess would be that you'd probably be able to emulate all the circuits
>which are obsolete today. Maybe with DSP:s. But once again, why?
>

Why emulate the circuits? Why not use the faster replacement chips that
have come out, and utilize their abilities to extend the ST even further?

>Buy a Milan and develop a nice driver for the latest graphics cards
>instead!

I'm looking for a Milan site now.

My TT has been writing errors to the floppy drive for some time, all though it seems to read OK. I have a spare STE for parts and need to know if the suspect
     TT chip "WD 1772-PH, 02-028714, 738801105",
can be replaced with my
     STE chip "C302096-001A, TC24C060AP-002, JAPAN 9213EAI".
Both chips are 28 pin and socketted.
I'm certain that the TT chip described above is the FD controller chip, but would like to ascertain that the STE chip described is also a FD controller chip, AND, that it is OK to replace one with the other without damaging the TT.
I'd be glad of your help, as ATARI technicians are gone around these parts now. Thanks.

Steve King

This "special multi-sync montior" stuff, are you totally sure about it? I mean, low-res VGA on a PC (same as ST lo-res) only refreshes the monitor at 70hz, which I make to be 14khz, BELOW the 15.625khz that the ST supposedly requires - but not a multiple of the 31khz you claim as the minimum for PC monitors (which doesnt seem to fit in with any resolution/refresh rate combo I know of). The ST could overscan to something like 340x270 from it's original 320x200, whilst operating at 60hz, putting it a bit ahead of VGA.. :) :)

..and I remember in a very reputable and well-read ST magazine that with some wiring diagrams they displayed, you could create a lead for ST --> VGA with built-in Colour/Mono switchbox, with the caevat that the computer and monitor should both be very firmly off when switching... also there was an option to build a small speaker into the switchbox to compensate for the PC monitor's lack of sound.

Care to fill me in? I am unafraid to be shown as someone ignorant of the truth.. some diagrams telling me how to fix my phillips CM8833 without killing myself with residual current (or spending more than the monitor is worth) would be nice as well.

(oh yeah -- the CM8833 was quoted as being an "Atari ST/Commodore Amiga/PC CGA monitor" in an advert in the same magazine. [I can send a scan if needed] -- and this monitor can display CGA, so it must have at least one display mode in common)

Email would be nice as I dont get the chance to check my newsgroups too often, and the replies get wiped by the sever.

I have a couple of questions about the Atari TT030.

There are 8 switched and three jumpers. Does anyone know what these switches and jumpers do?

I am attempting to install a 1.44 drive in place of the 720K drive my TT030 came with. I have a good working drive and it now works great in 720K mode, what modifications do I need to do to get it to work as a 1.44?

Thanks,
John

Click on one of the files so it is highlighted, and go to file on the main menu, and select SHOW INFORMATION. See if the file is flaged to READ ONLY. If it is, deselect it to ARCHIVE. I had this same problem also, and that was the solution.

I hope this helps.

I am looking for an ST/Falcon/TT030/MegaSTE...preferably with 1 meg or more, and hopefully with a 1.44 meg disk drive, hard drive, monitor, etc...a complete system...

I have the following to offer for trade:

WiseCom 56K PCMCIA Data Fax Modem
TDK 56K CyberExpress 5600 PCMCIA Data Fax Modem
USRobotics Megahertz 28.8 PCMCIA Data Fax Modem (with XJACK)
Practical Peripherals 28.8 ProClass Data Fax Modem

Compact Flash Memory (for use in Digital Cameras/Palmtop Computers/Handheld PCs
Simple Technology 12 Mb
SanDisk 40 Mb (2)
Lexar Media HighSpeed 4x 32 Mb

If the deal is right...
HP660LX Handheld PC (Windows CE 2.0, 32 Mb RAM, with 40 Mb CompactFlash storage)

I have made TOS-IDE card for ST (provision for TOS2.06 EPROMs + IDE
interface) and upgraded
many ST's that way, so it has been tested and I know that it works. Still,
there are a few things that would need to be fixed on PCB and a some kind
of manual to be written in order to be applicable as a homebrew project for
average hobbyist, but that takes time, which I'm short of.
I have schematics and PCB in TANGO-DOS format and I would do the remaining
work for free if there are at least 5 persons interested in doing it for
themselves or ordering parts from me (programmed GAL & PCB) ...
Equations burned in GAL are also available for free...

Regards,

Branko

Hi

I hear that System Solutions or the Upgrade Shop in the UK, do a kit with an IDE drive (170mb, I think) for around 100 UK pounds.

Yes, that is a bit sad. How about connecting it to an Amiga? I believe it has
got the same incompatibility issue with Linux PLIP.

For some reason only the SCSI driver in HDDriver V7.12 will work with my
ScanX scanner driver. Later versions either crash my Falcon or (in 7.55)
lead to the driver reporting that there is no scanner connected.

I'm quite happy with 7.12 but it's been reported to me that a bug affecting
VT52 and some disk-based operations seems to have been banished with 7.55
(I'm not clear on the detail but believe it's connected with unpacking FTN
message packets with STZIp and Jetmail).

I wonder if anyone can help with a few questions I have...

1 - Can a second level cache be added to the TT030? If yes, how and where from :)

2 - I read somewhere that the VME bus can support several devices - is there any way
to expand outside the machine and still use my gfx card? Can the VME be adapted to

work
with, say PCI or ISA (like ACSI to SCSI) or is it more complicated than just data
and
addressing?

3 - How can I modify my serial port to give more "standard" rates?

>to expand outside the machine and still use my gfx card?

Yes you can. At the past Neuss-fair I've bought me a VME bus adapter that
let me connect two VME devices. I haven't install it yet. I'm not handy
at all with tools so I'm waiting until I find a kind soul who will do it
for me. Are you reading this Jo? :-)
The adapter is basically a flatcable with on the other side two other VME
connectors and a small print plate. It should be possible to use it with
the standard TT030 house by letting the cable out the house but then
ofcourse the whole thing is just visible. I planned to buy/let me make a
tower so everything will be properly housed.

I've bought it for 50 DM,- at:

I don't have detailed schematics of TT, but judging from what I have seen in its guts best
place would be between CPU and the rest of the computes especially when combined with
faster CPU, since the ones I have seen were 32 MHz and all of them have had a small adapter
board with faster CPU fitted into CPU socket. So if one needs adapter for anything faster
than 16MHz, it would be the best place also for cache RAM&logic also.

Proper VME backplane can support up to 21 cards (as defined by VITA). Unfortunately, since
TT's initial price tag was measly 10 KDEM or so, they did not bother to do it the right
way- it should be done as a card for VME...I think that making adapter for proper backlpane
should be relatively easy- at least from electronic point of view.
Same goes for adapter VME2ISA, but PCI would be more difficult. I think there are cards
that do that, but price is probably very high , IMHO mainly because VME products are aimed
at wealthy industrial applications.

I recently got a Floptical drive which I use with my 16MHZ 4MEG Atari STe no problems using a ICD Link cable (the earlier type without clock) and have had no problems using it.

However my main Atari is a Falcon and I've yet to get it working with that as the Atari HD software and an early version of HDdriver 4.61 won't format the discs. This software obviously isn't sending the code to enable writing to the drive. Is it possible to use the ICD software with the Falcon SCSI interface? I just thought I'd ask before trying it and buggering it up.

Alternatively is there any specific Floptical software available for the Atari.

How about pd hard driver software?

Accordingto the maker Uwe Seimet of HDDriver the current version is
'certified' for Floptical. Si his uitiliy for formatting should be
uptodate also. Ask him.!

That's simply because formatting was not supported at all with this old version of HDDRIVER. (The current version is 7.6.) With the current version you should be able to format any SCSI drive. Note, however, that formatting is a waste of time if your medium doesn't have bad sectors. Partitioning is usually all that has to be done.

> Alternatively is there any specific Floptical software
> available for the Atari.

In case the floptical is compliant to SCSI no special software should be required.

If it is the Same as my PC5 any standard Scsi hard drive up to about 500Megs will work. Also if the motherboard has the same slots that mine did (I changed the motherboard in mine and got rid of the Intel Processor and installed a K6-2) you can install a ISA IDE card and run any Ide Drive made up to the same 500 Meg limit.
You may exceed the 500meg limit , But you must partition the drive as the Atari Bios will not recognise large drives. The Bios also doesn't support LBA mode for the drives. This is why I removed my motherboard.

Harold.

PS the Original motherboard is framed and on display above my PC5. It is an interesting conversation piece. Friends are Sooo suprised to find out that Atari made pc's especially when they also see my Atari PC windows 3.0 manual sittng next to the machine

If it's done right, I suppose you'd pack your existing system in a nice bigtower or 19" casing, expand the VME standard used to full height, full A32/D32 with backward compatibility to A24/D16 and A16/D16 as used in TT and MSTE, add bus mastering support and give about 5 to eight slots (like the TT/X was supposed to have...).

Right?

Or you just use software to circumvent the BIOS (I know there was some sort of bootmanager called "Master Blaster" for hard drives available for it that did this). Or use an operating system that doesn't really make use of your BIOS. Have you tried using it with Linux?
Also, if you replaced the mainboard AND refitted it with a K6-2, why not refit it with a new BIOS as well????????

I thought new mainboards usually came with BIOSes........

I believe the Panther series of video cards for ST's / STE's / MSTE's did
exactly that (ISA)
with a ROM port (allowing you to use generic VGA cards in the adapter so
long as there
is a video driver for that particular chipset avaiable. Perhaps it can also
be done on VME.

CTX 3436 and NEC MultiSync 3D should support the old 15khz horizontal
frequency with
50 and 60Hz vertical.

MultiSync is a reg. trademark of NEC. The generic term is, to my believe,
multiscan.

Most 17" VDU's and larger are of the multiscan-type although virtually none
of them
supports the OLD 15kHz line frequency standard. They all start at, say 31kHz
(VGA) and most
give up above 56kHz. The NEC and the CTX's mentioned earlier are exceptions
to these rules,
but they're 14". I use a 3436 on my Falcon so I can run RGB-only software on
it as well.

If you're only interested in mono, try getting a hold of an old mono VGA
VDU. They're picture quality
is not as good as SM124 or SM144 though. Remember that standard VGA uses
31kHz and 60Hz
rates, the Atari mono did 35kHz and 70 (SM124) or 72 (SM144), AFAIK. At the
time of introduction
to this date, these are pretty good values and have been for years, right?
:-)

Aren't there any cheap STVGA-adapters readily available? I know they were...

Or you could buy a video card.

First, read Chris Gray's reply :-)

Second - if you got yourself a RGB cable that connects to a SCART connector or A/V connector on a TV-set, then that is - for colorful games - probably the best way to go (rather than using a TV-modulator to send a RF signal to your TV's antenna in - this does distort the image quite a lot). If you have a mono monitor, you could try some colour monitor emulating software (if it still exists).

That's for ST games. If you'd like more professional (colorful) stuff, get a videocard. If you use it professionally in mono only, the standard mono monitor will do just fine (even keeps up with today's standards :-)

Have you ever considered making something like that commercially available?
How about a standardized, easy to open, cartridge with standard SIMM or DIMM sockets

Then, Atari users won't even need to open their cases to add more RAM to the system
Kind of like some organizers. :-)

Or perhaps a PCMCIA Type III converter for the cartridge port might be nice.
It should also
work on ALL Ataris with the cartridge port (e.g. not bus or processor dependant).

This is one case where it's beutiful that the ROM port isn't buffered :-))

That sounds rather like some buggy program in the AUTO directory or
a buggy ACC.

Can you boot from floppy and then access the HD?

Which HD do you use (Megafile?) ?

Unfortunately that would not work very well: the cartridge has no write signal (you can only "write" by reading, with hardware specially designed to take the address read from as the data to write); and the cartridge port has a rather small address space.

For a special purpose application, where a special driver supporting the above features can be used, this would be possible. But not for extra system RAM.

I'm encountering a problem with an Quantum 2100S Empire series drive. When I plug my LINK into it, the drive won't spin up, or show any recognition through software.

Is this non-starting behavior due to the drive waiting for some kind of signal to get moving? Or could it be some kind of break-down of the mechanism/controller?

Note: I do have both data and power cables plugged in.

Later...

Not wanting to detract from Bobs question, the bios on the Atari PC motherboard was left intact as I believe that to alter the original bios would be to alter a piece of Atari history. Which is why I removed and displayed the board. Yes you are correct in assuming that new motherboards do come with new Bioses Preinstalled on the board so refitting the Bios would be a moot point wouldn't it. In reference to the K6-2 , It was placed on the NEW motherboard . When I said I got rid of the intel processor I meant that it remained with the original board. After all in the O/S2 warp / Wintel universe one does not make much progress with a 386....

Hello, I have decided to sell one of my Falc's.
It's an Atari Falcon Motherboard with all audio
and clock-patches. It has also FX-card with 10Mb
Fast-RAM and 4Mb ST-RAM mounted by dealer.

With FX-card you can run your falcon in 16,18,20,
32,36 or 40 Mhz. This one is stable in 40MHz and
you can run CAF in 806x744 in 16 colors.

The price is including some programs too.
Located in Sweden.

$375

The PC3 is just a normal IBM XT in an "Atari" package. You will need an 8-bit hard drive controller card (which is probably already inside the computer) and an MFM or RLL hard drive (only available used or from an XT bought at a local garage sale).

Note that the XT/PC3 does not have a CMOS as such so you will not be able to set up the hard drive as you do on an everyday IBM-compatible. You will have to use DEBUG and other things on your Atari DOS disks.

Hope this helps.

Regards,
Randy Kwak

If memory serves, you'll find the OBJECT structure defined in AES.H for Lattice.

Coming back to what I said (ay least I think I did!), the ob_spec entry of the OBJECT structure does multiple jobs. In my compiler (Mark Williams C) it is simply defined as a 'long'. Reguardless of how it is defined, getting access "through" ob_spec is not obvious until you are familiar with 'casting'.

Thus, if your form has a simple G_STRING entry then ob_spec will store the address of the string. Assume you named this G_STRING entry as MYSTRING and that you called the form it resides in MYFORM ...

```
main()
{OBJECT  *ob;
 char    *s;

 /* appl_init, rsrc_load etc */

 rsrc_gaddr(R_TREE,MYFORM,&ob);
 s = ob[MYSTRING].ob_spec; /* compiler moans */
 printf("%s\n",s);
}
```

In all likelyhood your compiler will moan. Mine would warn "integer pointer pun" which is its way of telling me I am attempting to assign an integer value to a pointer and its likely to be a cockup on my part. In this case it isn't so we need to shut it up like this ...

```
s = (char*)ob[MYSTRING].ob_spec;
```

That isn't too bad but you'll soon get sick of doing this. It is also a sign of poor program design but in this case there is no alternative. Consider TEDINFO. This is used for editable fields. Given that MYFORM has an editable field called MYEDIT you'd naturally (!?!) attempt this ...

```
s = ob[MYEDIT].ob_spec->te_ptext;
```

It's on the right track but produces two errors and a minefield of syntax possibilities. Firstly, ob_spec (with my compiler) is defined to be a long and there's me trying to deference it with -> as though it were some sort of structure. Secondly, because the compiler can't get past the first error, it doesn't know what te_ptext is and warns about "integer pointer pun" yet again - even though te_ptext *is* declared as a (char*). Just to annoy me further it tries to be clever in that it will figure out te_ptext is a member of the TEDINFO structure and proceed to tell me ".0 is not a member of ob_spec". I won't even bother trying to explain that error! Needless to say it is all very confusing.

Casting is again the key ...

```
s = (TEDINFO*)(ob[MYEDIT].ob_spec)->te_ptext;
```

Oh brilliant. How the heck are we supposed to figure out that one when we're new to C - no way!

The best solution imo, is to either to use macros or write a set of small functions. I use macros because they're more efficient and better suited in this case but functions are easier to understand and a darn sight easier to debug.

The macro way ...

```
#define TePtext(ob,x)           ((TEDINFO*)ob[x].ob_spec)->te_ptext

s = TePtext(ob,MYEDIT);
```

The function way ...

```
char*
TePtext(OBJECT ob[], int x)
{
 return (TEDINFO*)(ob[x].ob_spec)->te_ptext;
}
```

Whichever method you choose, once done you'll not have to worry about it ever again.

Incidentally, the reason macros are better suited here is because the same macro can work both ways ...

```
s = TePtext(ob,MYEDIT);
TePtext(ob,MYEDIT) = "Hello World"; /* note caveat below */
```

... whereas to do the job properly (not strictly true but this is complex enough) with functions you'd need a GetTePtext() and a SetTePtext() function ...

```
s = GetTePtext(ob,MYEDIT);
SetTePtext(ob,MYEDIT,s);
```

>So, thanks for all your help.

No. Problem. :-)

Oh, one last thing - I nearly forgot. When in doubt with casting there's absolutely nothing wrong with breaking it down into sections to keep things simple.

```
main()
{OBJECT  *ob;
 char    *s;
 TEDINFO *t;  /* so we can break the cast down */

 /* appl_init, rsrc_load etc */

 rsrc_gaddr(R_TREE,MYFORM,&ob);

 t = (TEDINFO*)ob[MYEDIT].ob_spec;
 s = t->te_ptext;
 /* manipulate 's' as desired */
}
```

Er, just when I thought I'd finished: note that the space allocated to the string is fixed at design time in the resource editor. Initially, just ensure you enter enough text to ensure space is fixed for the longest string you will enter (and take care to ensure this is not exceeded). It can be changed at runtime but it usually isn't worth the effort. Note also that the following code accidentally changes te_ptext at runtime ...

```
TePtext(ob,MYEDIT) = "Hello World";
```

... and will lead to problems as it changes the pointer (but was perfectly valid to illustrate the macro works both ways). Use this instead which changes the contents which is what we want ...

```
strcpy(TePext(ob,MyEDIT),"Hello World");
```

I don't know much about this drive but you could have a good look at
the jumper settings. There is often one which determines whether the
drives starts up on Power-On or whether it waits fro a 'Start'
command from the software.

Hi everyone! :-)

Recently I bought a serial mouse, (Logitech Cordless Mouseman PRO) but as my Falcon only has one serial port, I can't use the mouse and modem at the same time.

I have twice tried to use the LAN-port for the modem, but I can't get it to work.
The first time, I got the modem to dial and do the handshaking, but I couldn't send or receive anything...
The second try (some weeks later) I couldn't even get it to dial ...so then I gave up! :-)

How should I configure HSMODEM7 so I can get this to work?

I have also been told that it is possible to get the MODEM1 port avaliable with some work, but I havn't found a description how to make this possible.

Have anyone got this description?

I would be very grateful for some help! :-)

The HD may be waiting for a signal... but the HD may also be incompatible with the LINK.

Check the jumpers on your HD!
There may be a jumper for a "motor delay"(or what it is called).
Try to get hold of information about your harddrive, so you know which jumper it may be! Try Quantum's homepage!

Good luck! :-)

The right-hand side of my Atari ST's keyboard has stopped working - that's all keys to the right of the "Y" in qwerty. Opened it up and can't see anything that seems to be particularly right-sided. The machine was moved (fairly gently) to a new address shortly before this problem showed up.

I'd appreciate any ideas.

If the problem IS with the keyboard itself, where can I get it fixed/replaced ?

Thanks in advance.

Anyone built an ST from scratch? I've seen all of the schematics up on various websites. It's look pretty straightforward. And with all of the technical info available, it seems like a perfect project for the inspired hobbyist.

I, personally, am inspired, but can't seem to lay my hands on decent schematics. The ones I have are badly scanned.

It's the *700's that have a comms port. BTW, the 9700GE uses AAA batteries and has a low power screen - I havn'e changed them in the 3 years I've had it (granted it's not been used as much since I left Uni a couple of years ago, but hey!)

Thanks again, I'll fire your message home and try it. (However, it is car modification time tinight!!!)

Gav.

It's probably easier to buy a dead machine and cannibalize the keyboard.
You can get one for next to nothing nowadays.

Cheers,
Nick

You can buy them from Best Electronics. Some other Atari dealers might
still have them.

Cheers,
Nick

Hi All,

Does anybody knows, is it possible to connect HDD Quantum Fireball
1.08 GB to the internal SCSI host-adaptor of MEGA STE?
I got this HDD in a bargain price. It works perfectly with a PC,
but my MEGA STE can't see it.
I tried to connect it to the internal (original Atari) and to the
external (HDP-Link) host adaptors, but with no result. None of
them can see this HDD, although HDP-Link seems to support parity
control (Fireball has not a jumper "Parity Enable").
I am using ICD driver. I tried HUSHI too but with no success
also.
Do you think, can any driver (HDDRIVER?) solve this problem?

Thanx for any help

Try "Vezz's" homepage. I forgot the URL, but he has a 'hardware hacks' page.

Isn't the ICD stuff supposed to only work on an ICD Link ?

You should download either AHDI (from the Quick FAQ) or the HD Driver
demo.

Cheers,
Nick

Need some space, so I'm clearing out some of the big stuff. All items are
AS IS. Working Mega STe motherboards will be tested before shipping to
make sure they power up and still work.

Working Mega STe Motherboard
$50 (no RAM, TOS or Power Supply)
$85 with TOS 2.05 (limited supply), 4 1 Meg SiMMs, and Power Supply

720k Epson Mech Floppy with Small Rhombus Eject Button
(Used on 1040 STe's, Mega STe's, TT's, and later Mega ST's)
$17.50 each with purchase of a Mega STe Motherboard
$25 otherwise

Non working Mega STe Motherboards
$20 (no RAM, TOS, or Power Supply)
$35 with TOS 2.05 (limited supply), 4 1 Meg SiMMs, and Power Supply

Mega STe Power Supply
$5 each with purchase of a Mega STe Motherboard
$10 otherwise.

4 1 Meg SiMMs
$10 each set with purchase of a Mega STe Motherboard
$15 otherwise

TOS 2.05 2 Chip set for Mega STe
$30 (limited supply)

Non-working 1040 ST motherboard
$15

Working 1040 ST's with internal floppy and TOS 1.0/1.2 (Machine Only)
$40

Xtra-RAM SiMM boards for STs
$40 for 2
$50 for 2 including 4 1 Meg SiMMs
$58 for 2 including 8 1 Meg SiMMs

Portfolio PC Card Drive
(ISA Card to plug into a PC to read Portfolio Flash Cards)
$15 til 10/25/98

Portfolio Parallel Port Interface
(Connect a Portfolio to a printer or a PC through a LapLink cable)
$12 til 10/25/98

Well it powers up locked and needs a code sent to it so you
can write to it. That seems non standard. But after that all
seems pretty normal.

Cause is probably bad connection somewhere on the PCB.
If the microcontroller on the keyboard PCB is socketed, try reseating it.
If that does not help, you will have to inspect PCB itself, but be
carefull not to loose
too many screws or a rubber thingies in the process...
Between PCB and every plastic key there is small rubber with conductive
tablet, which makes contact at he keypress-don't loose any of theese !

Regards,

Branko

Just passing by and noticed your remarks:

Coincidentally, I use a SCSI 135 with my ST-4. No problems here. Of course, I never turn off the 135 (grin). I have no problems with disk changes or anything! I only have two disks allocated to the Atari, anyway. One is the boot disk which also contains ALL of the programs and data I have and use regularly. The other disk is just a backup and archive place I use once in a blue moon. After all, one meg of storage with the ATARI holds the equivalent of 10 gig of PC data.

For what it's worth, I took an old game cartridge (don't recall which one!) and re-wired it as a RAM-disk ... pulled out the roms and replaced them with a pair of 8-meg ramchips, re-wrote the controller so gemdos recognises the cart port as an addition to native ram and - viola! - I now have a MEGA-16 (the first 4 are reflected).

I've been using Sting for a long time with no problems but now it's screwed up. After dialing and connecting it initializes something and the timer counts down from 60. The timer ALWAYS stops at 51 and the whole thing freezes up except for the mouse. I've deleted it and re-installed it but with same results. What can be wrong. I also have CAB 2.7 and PPP connect but I can't get iconnect to dial the number. Somebody please help.

Joshua

>
>On the programming subject, does anyone know how to correctly "walk" an object tree?

Not sure what you mean exactly here. If your intention is to traverse all the elements of a tree then there's very little need for it in practice.

Rather, if you desire to draw an object tree so that it does not scribble over other windows which might be displayed then you need to walk the rectangle list - obtained via wind_get() and drawn via objc_draw() implementing the clipping rectangles which Gem returns for each wind_get() call, terminated by a rectangle with zero width and height.

>(I've just been teaching myself as I go along, so I'm not completely clued up on C). I am trying to use some forms in a program, with buttons, text entry lines etc. and I can't figure out how to get access to the individual text elements to read their final state.

Assuming you are using a resource editor:

Each form is an OBJECT array. The only thing you know for certain is that the root object is element zero (there is usually a macro called ROOT). The positions of the other OBJECTs in the array are not known - this is why you need to name the objects which you want to manipulate. The resource editor will create a header file using the same base name as the resource name. This header file needs to be included in your program.

For example. Imagine you create a resource called FRED with a form which you name F1 and this form has two buttons which you name F1OK and F1CANCEL. The resource editor will create a file FRED.H which contains this ...

```
#define   F1       [somevalue]
#define   F1OK     [anothervalue]
#define   F1CANCEL [yetanothervalue]
```

... but you don't need to look in FRED.H, just add it to your program thus ...

```
#include "fred.h"

main()
{OBJECT  *ob;
```

```
 rsrc_load("fred.rsc");
 rsrc_gaddr(R_TREE,F1,&ob);
 ...
}
```

When you want to interrogate your 'ok' button simply do this ...

```
if (ob[F1OK].ob_state & SELECTED) {do something}
```

... the above simply 'does something' if the button is selected. The same applies for the 'cancel' button (ie ob[F1CANCEL]). Always use the names - the resource editor deals with the values. Note that every time the resource editor saves something you need to recompile just in case the values associated with the names have changed. If you don't wierd things might happen, and your program could even crash.

>Any pointers much appreciated.

At first glance you might think this ...

```
ob[F1CANCEL].ob_state = SELECTED
```

... will cause the 'cancel' button to be selected. In a manner of speaking it does but there are two errors here. First, the code inadvertantly clears all the other values within ob_state. It is a bitfield. The correct way is to do it like this ...

```
ob[F1CANCEL].ob_state |= SELECTED
```

The reverse (clearing it) is ...

```
ob[F1CANCEL].ob_state &= ~SELECTED
```

The second error is obvious when the program is executed. Visually, nothing will happen. Changing an object in this manner does not cause an immediate visual change. This will only occur next time the object tree is drawn. The objc_change() call is provided to cater for this.

That should get you started. One further point: the more complex objects do not fit into an OBJECT. In order to store the extra information required by these more complex objects the ob_spec entry of an OBJECT points to further information. The information pointed to varies according to what the object is. A G_STRING for instance has ob_spec pointing at a nul terminated character array whereas a G_TEXT has ob_spec pointing at a TEDINFO structure.

If you have trouble figuring out how to get at this extra data post in comp.sys.atari.programmer.

You're an asshole.

Our market is small, the little development that is left needs our
support, otherwise it dies completely. If the author gets no support for
his work, there will be no more new versions of the software.

Make an effort. HD Driver is cheap.

Thanks to Rich Davey, The Atari ST QuickFAQ is now available at the
following address:

http://quickfaq.atari.org

Much easier to remember and to communicate.

Because this a rerouting subdomain, some (old) versions of CAB.OVL will
not cope with it. The old address is still valid:

http://www.mygale.org/~bales/quickfaq.htm

Cheers,
Nick

I am very interested!!!

I have owned a used TT for a couple of years and like the machine very
much except for the lack of a good video output. To have the option to
buy a
video card would be a dream come true. It seems they video boards for
the TT are no longer available.

FYI, Mario has helped me in the past. When I first got the TT, I
managed to scramble the data on the hard drive somehow when adding
addition hard drives to
the SCSI ports.

I thought all was for lost. Fortunately, Mario answered my call for
help. Over the course of several weeks, he managed to fix the boot
sector and
instructed me how to use the editor in Diamond Edge to reconstruct the

drive so I
could read the data. Wow, I was impressed. I told all my friend how
someone on the
other side of the world saved me from reformating my drive and
destroying my important
files.

Mario, what a guy!

Thanks again and I look forward to future developements. Please feel
free to email when the your board is available.

What I can do so far ...

Create the resource tree using the built in editor (in Lattice C).

Load the resource file.

Assign the various trees their address pointers.

Display the form with text entry fields, buttons etc.

What I can't do is assign the text entry fields with a default string
(which is variable, depending when the form is called, so just entering
a default in the editor is no use), and also read the value of the text
entry fields after the form has been closed.

However, after reading your posting Guy, you may of put me on the right track. I can't remember if I defined anything as an OBJECT. As I said, I am (sort of) picking C up as I go along. Also, it's been so long since I played with this program, I can't remember exactly how far I got.

So, thanks for all your help.

The program will be finished eventually. In case anyone is interested in it, it is a programming for transfering programs/files to/from a Casio fx-7700 / 8700 / 9700 graphics programmable calculator. I can't promise it will be ready soon - I started it a few years ago (the conversion that is), however I started getting into playing with cars and drinking lots around the same time, hence the long conversion time. But, it's one of these things - I've started, so I'll finish!!!

Gav.

This is NOT an official announcement, but I want you to know that Mario is now in the circuit design stage of making a graphics card/accelerator which will work on the TT030. It will be made initially to work on the ST/STE with the idea of bringing the machine into the 'modern world' so to speak. You will then be able to plug a SVGA monitor into it and use the internet and have decent graphics. With the new CPU it will be faster than the TT030 also.

TT030 owners will get more than the usual 16 colours for a change - and
the full screen being used for a change!! Not to mention photographic
quality graphics... CPU upgrade to boot...

So if you can wait or spread the word to other TT030 etc owners we would
like to know how many would buy this upgrade and how much you would pay.

I mean, if you want to pay, I'm sure Mario will upgrade the CPU to a 68060
if you want. I can't wait for him to finish it!

Other serious suggestions are welcome.

I'm using his PC mouse adapter and I'm most impressed. Especially using
the Genius Net Mouse with the double click and left-click-and-hold on the
middle rocker-button. I didn't realize how it makes the computer easy to
use, you don't realize it 'til you try it!

Does the job require full knowledge of the Atari ST platform ?

Cheers,
Nick

> Thanx, Erik Nienhuis. bernadette-erik@wxs.nl

I assume you have a hard drive connected, because otherwise, you can just stick any 720K DOS formatted disk into the drive to boot up.

TOS is in ROM, it doesn't boot from a disk, but the ACCs or AUTO programs do, and so does the HD driver (SHDRIVER.SYS). You should always have a backup copy of AHDI on a floppy disk.

You need to bypass the HD to boot from a floppy. With AHDI, press Control when it's recognizing the drives. Other software has other means of bypassing the HD (Alt or A or whatever...). Read the driver's docs if you have a doubt.

Then, add a "C" icon, and access the HD to remove the culprit accessory.

If you can't bypass the HD, switch off the drive, switch on the computer, boot from a blank floppy, switch on the drive, then run AHDI from a floppy, and proceed as above.

Cheers,
Nick

It's also excellent. I've bought several versions.

The latest one incorporates a Generic SCSI Driver, which sounds like a Good Thing - but what applications actually use this?

Erik, I'm guessing that you installed the ACC on your father's hard drive. Do you or your father have a hard-disc driver on floppy somewhere, such as AHDI.PRG or the excellent HDDRIVER.PREG? If so, then proceed as follows:

- boot by-passing the hard disc: this means IIRC holding down ALT during bootup. If that doesn't work, try CTRL or even both. :)

  The aim is to arrive at the "bare desktop" with two floppy icons and a trashcan.

- insert the floppy into the drive and run the disc driver by double-clicking on it. Now select "Install Devices" from the desktop menu and hey presto! drive "C" should appear.

- delete the offending accessory, or rename it to *.ACX, or whatever.

Floppy discs formatted as DOS-compatible 720 KB should work fine. But you don't need TOS on floppy, as you already have it in ROM.

Julian Rescke's CD-ROM XtendedFileSystem (XFS) driver for MAgiC
Nima Montaser's ScanX scanner drivers
Steffen Engel's GEMAr tape streamer backup utility

Those are the only 3 that I know of.

Unfortunately the only version of HDDriver that works reliably for me in the
generic SCSI driver line is 7.12.

GEMAR and SPIN.

The PD driver CBHD also includes (optionally) the generic driver.

Yep. That was the error.
Thank you.

Just 2 questions: why does STinG send PPP negotiation packets
even if there is no connection via Modem?
Why does the ATARI then throw bombs (is STinG going to the "Byte desert"
causing the Mega 2 to throw the bombs)?

> For logging into an ISP, the Dialer does the activation anyway.

Yep, works.

Thanks again

What happens exactly ? Is it an AUTO program or an ACC that crashes your
machine ? Does your hard disk driver get to display a message ? Does the
desktop eventually come up ?

Cheers,
Nick

This interface is not just available in the lastest version 7.6 but it was added to HDDRIVER about a year ago. A lot of programs use it, e. g. Gemar (for streamers), SPIN! (CD-ROM driver), MUCKE (CD player) and some scanner drivers. The software coming with HDDRIVER, e. g. HDDRUTIL and ZIPCONTROL also makes heavy use of it. Any application that wants to directly access SCSI or ATAPI devices profits from it.

How come I feel like I answer this question just about every day? Maybe you could read a few posts in newsgroups before posting yourself.

First, this is in the Quick FAQ: http://quickfaq.atari.org

Second, you must be aware that a VGA monitor will only be able to display monochrome ST-high res because of scan rates, and the display won't be as good as a proper Atari monochrome screen. For colour, you would need a TV or an RGB monitor.

Now, all you need is to connect the ST's mono out pin to the monitor's red in, green in and blue in, all tied together. Next, it's h-sync to h-sync, v-sync to v-sync. Last but not least, wire the ST's mono-detect pin to ground.

Ah, you also need to find a source for that 13 pin Atari DIN connector.

Pinout details are in the Quick FAQ.

Cheers,
Nick

As Nicholas would put it: It's in the FAQ.

http://quickfaq.atari.org

Remember, a "PC monitor" (SVGA actually) can only be used in the mono
mode (640 x 400 b/w) of the Atari. Colour resolutions are not
accessible, unless you have a special multisync monitor (very rare these
days!).

G'day, make sure when you start the game that the computer is in LOW res. Go to set preferances and select low res. Failing this it could be either the video cable or the video shifter chip on the main board.

I sell ready made cables suitable for connecting most (S)VGA monitors to
the Atari monitor port.

I'm selling them for 15 US dollars each, plus postage.

Email me if you're interested, or if you want one of my mouse interfaces
(more about those on my WWW page).

Hi!

Anybody got a good 68K assembler, macro or otherwise,
for a 1040STf? I need one!

Regards,

Jim

If you don't find one used, your best bet would be Devpac from

http://www.hisoft.co.uk

They are selling it now for �30 + postage and I guess to USA, too. It's a very comprehensive package containing anything you need for assembly programming with the ST. Except for programming skill, of course :-) That you have to provide yourself!

Colin,

is this a colour monitor or a mono one? Is the desktop green or grey?
Note that a PC monitor adapted for use with an ST will normally display
in monochrome, even if it was a colour monitor in its former existence.

Most games will only work with an Atari(*) colour monitor or a TV.
(*) Or compatible, including some multisyncs.

I'm looking for some specific info on the TT's mono video mode.

What is the horizontal/vertical scan rate?

Is it TTL or Analogue?

How is this mode determined?

Thanks for any help,

Lawrence.

I've got a Tandy Portable Disk Drive that I would like to hook up to my Portfolio. The only problem is that I don't have the cable :-(

If anyone has the cable pinouts or information on where to look for them, I would really appreciate it. It must be some kind of serial connection because the Tandy PDD has "RS232" written on the back of it above the connector pins.

Thanks!

I have this problem. You see I have an Atari Mega 2 and my diskdrive doesn't work. I mean the indicator led doesn't lit and none of the diskettes are readable.

May be this is because of the configuration, you see, none of the options refered to a file or the disk drive is available. I'm with my Atari so forgive my ignorance, I this might not be such a dificult problem after all.

> here:
>
> 1.) Max memory?

The Atari memory boards were available in 1, 4 or 14 Meg versions. Nowadays you can get a SIMM adaptor board to expand to 14Mb with a 16 Meg SIMM/

> 2.) Is the HD SCSI or IDE?

Internal 2.5" IDE, external SCSI. The C-Lab machines had internal SCSI instead of IDE.

> 3.) What type of monitor

Atari RGB (SC), monochrome (SM) or any PC VGA. You need an adaptor for each type of monitor. This can be easily home built or bought.

> 4.) Accelerators available?

Well, a few. Nemesis, AfterBurner040, CenTurbo I and II. This mainly depends on where in the world you live and local availabilty, some are only available in Europe or direct from the manufacturer. Some are expensive and replace the processor, others are quite cheap and only accelerate the bus or the video. Best is to ask your local dealer.

Cheers,
Nick

Does it spin when you try to access it or stay silent ?

Try openin up and ressing in all the connectors. Some of them might have come loose after the years.

If this doesn't fix it, then either the drive is dead or it's the WD1772 controller chip that's dead.

The first thing to try is replace the disk drive with a PC one. You'll find how to do that in the Quick FAQ.

If it's the chip, well, it's probably easier to replace the machine completely than to find a spare chip. Second-hand Ataris are cheap.

Cheers,
Nick

Hi

If the machine was working fine and had a period of unuse, then I would make sure ALL the socketed chips are firmly seated by gently pressing down on them.

I'm not that familiar with the Mega's (anyone want to donate one to me:)), if it follows the ST's norm then after a while the familiar Desktop should become visible. If this happens, does the desktop show the drive icons? if there are disk icons (A & B) then the floppy disk controller should be ok! if on the other hand there aren't any floppy drive icons, this could mean one of three things:

1) the disk drive is faulty
2) the floppy drive controller is faulty
3) they both are faulty (unlikely)

If you can furnish me with more info, I'll do what I can for you.

Hmmm, scsi came out initially expecting the host to take control. You
normally start out a scsi session by sending an init (initialization) to
get the ball rolling. I doubt you will find the adaptor will send anything
without having received that first. Whether this program would work if
after the init the scsi device responded (because of received input from
outside world) I'm just not sure. Since I suspect it was written by an
ICD engineer to help them with debugging scsi hard disk problems, it may
only respond to requests from the program.

I haven't been able to think of a way to get a harddisk to send something to the computer out of the blue so am not sure what kind of test I might be able to run to answer the question.

However, I still think the program shows you that it is possible to write a scsi bus snooper.

I live in the US.

Who would be the nearest Falcon dealer? I live in the Cleveland Ohio area.

Getting down to the last of the Atari ST items on my shelves.

These books are especially valuable sources of ST info. They haven't been available for many years, and when they're are gone, the information in them pretty much goes with them.

Priority Mail shipping is $3.00 for one or two, or they can be sent at Book Rate which is a little cheaper (and a lot slooower).

Misc. Atari ST Books - $10 each

Compute's ST Programmer's Guide -

The comprehensive guide to programming the Atari ST personal computer. Includes dozens of example programs, details on how to access advanced features and explanations of BASIC and LOGO. Includes writing GEM applications in "C".

Programmer's Guide to GEM - Sybex

A detailed introduction and reference guide for anyone wishing to develop applications for the GEM operating environment. Programming the VDI for portable graphics software, using the Resource Construction Set, a complete guide to AES functions and lots of programming examples in C.

GFA BASIC Book - MichTron

An intermediate programming tutorial for GFA BASIC, written by Frank Ostrowski, the author of GFA BASIC itself. It's designed for the person with a casual knowledge of BASIC who wants to gain an understanding of the more complicated aspects of the programmers' art. It guides you step by step through many intricate facets of BASIC and GEM programming, using GFA. Comes with a disk containing many of the program examples. This book is especially valuable for the practical insights Frank gives from his years of development on the ST.

ABACUS Software Atari ST books - $10 each

Volume 2 - Atari ST Internals -

The authoritative insider's guide. Chips, MIDI, GEMDOS, Sound, BIOS, Interrupts, Errors, almost everything you need to know about the ST.

Volume 3 - Atari ST GEM Programmer's Reference -

The complete guide to programming the ST using the Graphics Environment Manager. GEM, VDI, AES, GDOS, GIOS, programming, development, compiling C, inside GEM. Many example programs in C and 68000 assembly language.

Volume 4 - Atari ST Machine Language -

Complete introduction to machine/assembly language on the ST. Logical operations, bit manipulation, program development, 68000 register structures, memory structure, operating system, and more. Many examples and problems with answers.

Volume 5 - Atari ST Tricks & Tips -

Valuable collection of software tools and programming hints. Using GEM from BASIC, adding machine language to BASIC programs, super fast RAM disk, print spooler, starting TOS applications automatically and more. Contains program listings and color plates. A collection of info that didn't quite fit into the other volumes.

Volume 8 - Peeks and Pokes -

Keys to revealing the secrets hidden within your Atari ST. Using the BASIC "Peek" and "Poke" functions to: Customize the desktop, change the mouse shape, change the character set, read the keyboard or joystick, make your own fill patterns, direct disk accessing, system variables, pointers and the CPU stack, setting up the RS-232 interface and a lot more. This book packs a lot of valuable information all in one place.

Volume 9 - Atari ST BASIC Training Guide -

Everyone's introduction to ST BASIC. A functional, educational and well-written introduction to ST BASIC. From problem analysis to algorithms to BASIC commands. It helps teach programming quickly. Includes quizzes on the concepts introduced to reinforce the learning of programming.

Volume 11 - Atari ST BASIC to C -

Move quickly beyond the BASICS with the powerful C language. Use your knowledge of BASIC to move on to programming in C with the help of this useful guide. Shows comparisons between the familiar concepts of BASIC and the equivalents in C to make moving into this more powerful and versatile programming language very easy. Many, many programming examples.

Volume 12 - Atari ST 3D Graphics Programming -

Concepts and techniques. Learn how to create impressive and fascinating 3D graphics on the ST. Covers the basics, then moves on into more advanced concepts. 2D & 3D transformation, hidden lines and surfaces, data structures, spatial projection, screen manipulation, rotation, light and shadows, and more. Includes many programming examples in 68000 assembly language.

Volume 13 - ST Disk Drives: Inside and Out -

Discover the capabilities of the Atari ST disk drives. A book with in-depth coverage of the concepts and techniques of using floppy disks, hard disks and RAM drives. The book explains in detail the file structures, software, firmware and hardware that support disk functions on the ST. BIOS, DMA, controllers, tracks, sectors, clusters, gaps and FATs. Includes an extensive description and listing for a full-function disk monitor program to help investigate the ST's disks. Lots of info in this one.

I'd just as soon pack all of these into one big (and heavy) box, so make me an offer on all of them or bundles.

If you're planning on sticking with your ST, or are new to the world of the Atari ST, you need these books!

I have a Falcon running MagiC 5. I would like to write some programs under this OS. What kind of languages are available? Is there any thing like Visual C++ or Visual Basic. Any object oriented options? I would like to be able to use GEM functions. In other words be able to put a nice GEM front end on my programs.

I use Lattice C myself.

As long as you make your program event driven, it will multitask in the GEM environment correctly.

When I started out, I was using GFA basic, compiling the source into stand along programs (not interpreted) and I found that it had a few bugs when it came to screen re-drawing under Magic. When I converted these over to C, they worked perfectly.

On the programming subject, does anyone know how to correctly "walk" an object tree? (I've just been teaching myself as I go along, so I'm not completely clued up on C). I am trying to use some forms in a program, with buttons, text entry lines etc. and I can't figure out how to get access to the individual text elements to read their final state.

Any pointers much appreciated.

Gav.

Hello,

Dans son message ��Re: MagiC Programming��, Gavin Cameron a �crit�:

��On the programming subject, does anyone know how to correctly "walk" an
��object tree? (I've just been teaching myself as I go along, so I'm not
��completely clued up on C). I am trying to use some forms in a program,
��with buttons, text entry lines etc. and I can't figure out how to get
��access to the individual text elements to read their final state.

The simpliest way is to use some macros and the object-index.

The object index are saved with #define object_name in *.h files by many RSC editors, like Interface.

Suppose know you want to know the state of the objet EXIT_BUTTON in the tree DIALOG_2, whose address is adr_arbre[DIALOG_2].

If you define OB_STATE(adr, obj) as adr[obj].ob_state, you simply do

```
if ( OB_STATE(adr_arbre[DIALOG_2], EXIT_BUTTON) & SELECTED )
{
  /* what you have to do if selected */
}
...
```

Such macros are defined in xaes.h coming with interface; I think they are so useful they can be added to others aes.h

In summary : to get the field xx of the i-th object of the tree at adress adr, just do adr[i].xx (which is consistent with adr defined as OBJECT *).

Of course, that supposes you know the object-index of the object you want to use... But as the programmer, you should :-)

Jeffrey,
If you are using TOS 2.06 or higher, after the Atari logo appears (which is almost immediately) press and hold the Control key. This should allow the computer to boot from the hard drive but bypass the AUTO folder. I can't remember is this works on earlier versions of TOS, but I believe so.

I don't remember my STs as well as I thought...

After getting back from WOA '98, I tried to install some new stuff in my auto folder on my C:\ drive. The computer boots, gets to two bombs, and I end up looking at a desktop with a mouse that moves but can't click on anything.

I think I just need to get the ST to bypass the AUTO folder, but I can't remember how to do that, and I couldn't put my hands on the right manual...

Any quick help for a guy who should have known better?

Thanks,
Jeff

Hi Jeffrey,

You could try booting from a floppy, then running your hard disk driver program manually (assuming you have it backed up onto a floppy). Then mount the C: drive on the desktop and delete the offending items from the Auto folder.

Michael

As far as I can remember you have a couple of options.

1. Hold down left or right shift (I think) while booting.

2. Boot up with a blank disc.

After this, run the HD driver program (whichever one you are using) from
your original installation disc to mount the hard drive. Rename all the
new programs (to *.prx or something), reboot and it should still go.
Then try enabling them one at a time to find the culprit, rebooting each
time.

Gav

If you are looking to buy or sell Atari software or hardware then this is for you.

Coming soon will be an auction site/area dedicated to Atari gear. So if you want to bag a bargain or you want to sell some Atari related stuff and you don't know what it's worth, the an auction is ideal.

The auction will be aimed at the UK market, but I think selling to countries within Europe shouldn't be that expensive.

The auction will be run by one of the UK's largest auction sites and will hopefully allow people to sell and buy all sorts of Atari wares; 8-bit Atari's, Jaguar's, 2600, 7800, ST's Portfolio's ANYTHING Atari.

I would be grateful for all the support I can get for this venture,. If you would interested in using this auction service please let me know via email at AtariST@usa.net. Without you, the user's support this service WON'T get off the ground.

Thanks
--
Cheers! for now

Hi,
If someone can point me to a faq that would be really helpful.
I would like to hook a HDD up to my atari 1040st, and I need
to be pointed int he right direction.
Thanks in Advance.

Thanks everyone for the suggestions. This is what I've got so far:

I'm using a Mega 2 ST with an older TOS (not sure which) and a homebrew hard drive using ICDs Host Adapter and their autoboot software 4.8.4.

Holding down Control, Left-Shift, or Right-Shift on bootup seems to do nothing different, the autoboot software runs and runs the AUTO folder items, resulting in the 2 bomb crash described below.

Booting the computer with the hard drive powered down allows me to get to a desktop, but powering up the hard drive results in weird floppy response. Most importantly, any program I try to run from floppy (like a hard disk driver) gives me TOS Error #35 (the floppy also will no longer identify disk swaps, even if I look at Drive "B:", TOS asks me to put disk B in Drive A:, but it will show the directory of whatever disk was in A: when the hard drive was powered up).

Any more ideas or suggestions? I have a 520STfm and two 1040STfs if it might help to connect the hard drive to a different machine for some reason...

Thanks again for all the help,

Jeff

Hi Jeffrey!

I am sorry:
None of the tips so far will surely help you in each case.
Under normal circumstances your hard disk driver (AHDI or HDDRIVER) allows you to boot from floppy by holding down the ALTernate key after the floppy LED has flashed up until it boots from flopy disk, no matter which TOS version you have.

(Supposed you have an internal hard disk. Otherwise you simply could turn the drive on _after_ booting and starting the hd driver manually.)

Hope this helps.

Carsten

>Keep an eye out for more docs at http://atari.scum.org/
>

If I can help:
official Atari Falcon docs: 2/1/93
page hardware.34
states:

The Atari Falcon030 parallel port has been extended from previous TOS
products, to include two additional signals - 'Acknowledge', and
'Select'.
The nwe parallel port now looks like this:

pin # signal
1 strobe
2 data 0
..

etc
.
9 data 7
10 acknowledge
11 busy
12 -
...all the same
16 -
17 select
18 ground
...all the same
25 ground

'Acknowledge ia an input, active low for the rpinter. it is connected
to the MFP pin GPIP1.
'Select' is an output, normally used to turn the printer on-line. It
is connected to the PSG pin IOA3.

Met vriendelijke groet,

hiya.

just acquired a 1040st which i'd like to use with a composite monitor, but all my attempts thus far to locate a suitable connector for that funky monitor port have come up fruitless. is this some oddball proprietary thing, or are my local electronics stores just lax in carrying a full compliment of DIN connectors?

and while i'm at it, how exactly *should* i refer to this thing? 13 pin DIN? i tried describing it to a couple of counter monkeys at the parts place and they didn't seem to have a clue what i was talking about. the arrangement of the pins ("in a parallel pattern rather than a radial one like, say, a MIDI jack...") seemed to throw them in particular.

anyhoo, thanks in advance.

Simpy purchase a LINK97 SCSI host adapter and then connect any SCSI hard disk you like to it.

I've seen it in most electronics catalogs referred to as an 13 pin Atari
DIN socket, so I guess it's an Atari proprietary standard. Some people
have spotted the same connector on car audio CD players or something.

I don't know where you live, but Best Electronics cary these in the US.
Here in Europe, you can get them from Conrad electronics, Radiospares or
Maplins in the UK.

Cheers,
Nick

: arrangement of the pins ("in a parallel pattern rather than a radial one
: like, say, a MIDI jack...") seemed to throw them in particular.
:
: anyhoo, thanks in advance.

SFAIK "13-pin DIN" is the correct name. They do seem to be hard to come
by, though: try an Atari specialist dealer such as Best Electronics
(tel. 408 243 6950, Mon-Fri 1300-1700 Pacific time, says my trusty Newton).

Best Electronics (USA) or Maplin(UK) are good sources. They are available elsewhere, too. I can buy them in a local electronics shop (in a city of 150 000 inhabitants) but this varies, of course...

One possibility is to try some car audio shop, as this connector has also been used in some car stereo CD units. I guess it was JVC but I'm not quite sure about this.

Yes, "13 pin DIN" is the correct name. Now go and try to explain them the disk drive connector of Atari (a 14-pin "large DIN")and see their faces turn yellow...:-)

In the old days when nothing was available, I once made this connector myself. Just take a piece of standard perf board with .1 in hole spacing and cut a suitable round piece with a hacksaw. Then drill the 13th hole in the middle of the top row and fit suitable solder pins in the holes. Solder the cables to the pins, tie them together and secure the lot with some epoxy resin glue. Only takes a day or so to make and looks sooo professional ;-). That's DIY!

As long as the mech and board went to the same brand, model, and interface type, you're fine. I've repaired a few Seagate ST41200N 1 gig drives by removing the controller boards, with a good controller board. Some time ago, I bought two of them, one had a bad mech, the other had a bad controller board. You get the rest. I wound up with one good drive.

The other I mounted on a bat to pound spammers with.

Well... Yes and no. I have swapped controllers from identical model (Quantum Fireballs for example... has both a SCSI and IDE version) scsi/ide drives. If your talking say mix and matching let say an IBM and Quantum... Answers probably no.

I just wanted to tell everyone thanks for the information, my hard drive lives!

By booting with a blank disk in A:, the hard drive powered on , and holding down Control-Alternate-Shift, the hard drive was bypassed completely, allowing me to load the SUPBOOT driver manually (it worked even though my

Host Adapter is an ICD) and install a hard drive icon.

Thanks again to everyone who responded. It's been a while since I've dinked around on the Ataris, so it's really comforting to know that there's so many knowledgable folks still out there and willing to help.

Hold down the <Alternate> key after the system begins to start but before the
hard drive is polled. This works, at least, with an ICD driver.

1040 ST running TOS 1.0
Nothing is on the screen at boot up (except green)... and the top menu items....
but no floppy drive or trash can icons.
It's been a while since I used the ST and I can't remember what to do about this problem.
Anybody know?

Thanks!

My 1040st for some reason doesn't want to recognize my harddrive! Just last night it worked fine, but this morning they just stopped talking to each other. I have at least determined that it's a hardware problem (I hooked up the HD to my 520st and the same thing happened). Can anyone please give me some suggestions as to what might be going on?

That probably happened because your floppy disc drive is not properly connected or defective.

Is that one of the machines with no internal floppy disc drive? If so, check that your external drive is connected securely and has power.

If it's internal, remove the case and check that the drive is properly connected and not faulty (try another drive).

Also I think I've seen this happen when certain malfunctioning devices are attached to the ACSI / DMA port.

Unless there's something simple that I've missed??

Newsgroups: comp.sys.atari.st.tech

Hi Everyone,

I still consider myself a bit of a 'newbie' at this net business so please bear with me if what I have to offer is a load of bull - I can only say that it works for me.

I am using a 14 Mb Falcon fitted with Nemesis, running in single TOS.
My Internet software is quite limited and consists of:

STiNG 1.15 - to connect
CAB 1.5 - to 'surf' GFX-free for speed
CAB 2.7 Demo - to 'surf' when I want to see everything
CAB OVL - always the latest version as Dan puts it up
Newsie 0.92 - for mail and NGs

My CAB and Newsie programmes are kept in my COMMS folder on my Utilities partition.

Being a bit careful (?), I regularly check my partitions with Edge and soon noticed that Drive C always had at least one 'fragged' file. It did not take a genius to work out that this was probably the Log file created by the STiNG dialer, so I always made sure to put this file back to the drive as physically the last file when restoring after a back-up.

Reading of the 'problems' with Newsie, I decided to move my STiNG folder to a drive on its own in case my Drive C got corrupted. I have always used a separate partition for my Newsie folders (Download, Mail, Offline, Work) and another for my CAB cache folders anyway, and, not being short of HD space, this was no problem for me.

I have not had the corruption problems mentioned by some people before or after doing this.
I rarely read NGs on-line, though always read my mail as I get it from the server.
I always disconnect from server after downloading NGs.
I always quit Newsie then disconnect STiNG before reloading Newsie to read the NGs.

I have no complaints about STiNG or Newsie - other than, being ham-fisted, I occasionally delete NG items by mistake and cannot 'undo' it ! (I have mentioned this to John and he is looking at it.)

As I said earlier, this works for me. Perhaps a more 'basic' appoach may solve other people's problems ?

Hope this is of help.

ATB

Jim.

Our youth group has been given an old Atari 520ST with lots of games.

When the computer is switched on, a desktop screen appears but if the computer is booted up with a games disk the screen shows wierd images. The computer is connected to a monitor rather than a TV.

The game seems to be loading, the music plays ok, and the images occasionally show text, all be it as if words or images are being distorted and repeated across the screen.

Can anybody offer any suggestions on how we can get the games to show?

Thanks

Come on guys before replacing anything one might check to see if the drive is even getting power! It should be getting 5VDC this should be the first check done before suggesting replacing the drive or anything else. also no one has mentioned checking the MFP chip. IIRC the signals for the disk drive are routed throught the MFP. This is true for all the ST/Mega and MegaSTe's. I am not to sure about the TT or the Falcon. As far as the replacement of the MFP and the drive controller these chips are not that hard to find and can be purchased for about 20.00 In the US you can get these from Best Electronics or from B&C Computervisions. If all else fails drop Brad Cota of Best Electronics a email, this guy is a walking book of Atari.

From a repairman...........

Hmmm, sounds like a monitor/cable problem. What make and model is it?
Have you got a colour/mono switch box, and what sort of cable have
you got?

The ST displays 2 different types of video - it sounds as though
somehow it's booted up in colour mode when connected to a hi-res
monitor, or vice versa.

Does it happen with just one game or all? If just one game, do you
know of anyone else with an ST that you could try it on?

I desperately need some sort of graphics card for my TT that is compatible
with Magic and most applications. Could somebody please sell me one or give
me some info on where to get one. I'd appreciate it a lot. Thanks :)

That's what it means, but SOME of the reports that I've seen are that SOME of these controllers cannot handle more than 20Mb drives. Others have been successful.

If I were you, I would (actually I did) go for a TUS IDEal adapter that fits a 2.5" drive inside an STE. Very neat and approx UKP90UKP for the board and a 170Mb drive at the time.

Cheers,
Nick

You are of course completely right. The only thing I use mine for nowadays
is to run Compuserve Navigator. Sooner or later Compuserve will declare
this obsolete and my Spectre GCR will be offered on this ng "free to a
good home, buyer collects".

I have to disagree with you about (3) though. I have yet to meet a Mac owner
who was prepared to part with her old machine for a price which I considered
reasonable.

Hello,

Can i use an Atari LSM 605 laser printer, on my PC under Win95 or on my
Mac ?
What are the type of the connectors on such a printer (Atari) ?
If it's possible, what kind of drivers should i use ?

thanks-

One of us is being stupid. :) SFAICS anything which plugs into the modem port must have a 25-pin female connector, just like a modem:

```
  ST> >------cable-----> >modem
  ST> >export
```

A modem cable is um, idempotent. You can even concatenate them. You could plug a modem directly into the ST serial port if there were nothing in the way. You could use a modem cable to remote your Export from the ST if you wanted. (Given a good enough cable, a short enough distance, no friction and a perfect vaccuum. :>)

Hi All,

Does Anyone Know how I could wire a plug on my Tulip VGA monitor for my STE?

Does anyone know what the pinout to the 13 pin plug and what each pin does?

Thanks in advance.
Catch you again,

AFAIK, it's impossible. It can't even be used on an Atari Falcon.

SLM printers connect to an ACSI port (Atari's special HD/Laser printer interface) and use the computer's memory for printing. This is why they were the cheapest laser printers of their day.

Cheers,
Nick

[All together now] This is in the Quick FAQ.

A VGA screen, after homebuilding an adapter, will only be able to
display hi-res monochrome provided it can match the ST output
frequencies.

Pinouts are available from the Quick FAQ.

My personal tip : get a cheap SM124/125 screen.

Cheers,
Nick

This TT and the big monitor: In North America? East? West? near Boston?

I have a TT setup with what may well be an irrepairable monitor. It might be just as well for me to blow another wad of cash on your setup as to try to fix my blown TTM195. Can't get at the files in my Tt without the blessed monitor!

Any Techies reading this:

Do TTM195's blow their power supplies? ...Or is it always the Flyback?
my symptom: TT boots OK: can hear the drive accessing all the files in the usual order. Monitor: no green light on the pilot. Noting at all from the screen . All dark.

Is there one thing in there that usually blows? Does best Electronics have it?

HELP!

I hate to say it, but Howard Carson was right. he said that this monitor was failure prone. Unlike Howard, I can't just settle into a new Pentium with a 17-inch display running Windows NT. I just want my TTM195 back.

Symptom: TT boots as usual. I can hear the hard disk accessing all the files in the usual order, as it launches NVDI, &c.

Nothing from the monitor. Black screen, no pilot light. Is this a blown power supply? Is there a fix I can buy from Best Electronics?

HELP!

Hmmm I remember way back that there was a special interface (not by Atari) available for the Falcon bearing a name that had something to do with speed, which allowed you to connect any ACSI printer to your Falcon. The interface was connected using the DSP port. Sadly, I don't remember its name right now.

>
>SLM printers connect to an ACSI port (Atari's special HD/Laser printer
>interface) and use the computer's memory for printing. This is why they
>were the cheapest laser printers of their day.

As for ACSI - this was Atari's own cheaper version of SCSI, so in theory it should be possible to do the reverse of what SCSI adapters do (I think). However, this is not sufficient.

The Atari laser printers could be compared (again, I think) with today's GDI printers. They have no memory or intelligence whatsoever on their own, making them cheap peripherals being controlled completely by the computer. The ST had to make up the pages using its own dual-purpose memory, much like true Windows (GDI)-printers do. This had the advantage that when you updated your computer, you automatically updated your printer as well where processing power and memory capacity is concerned. On the down side, it does put a drain on your computer. And you used to need at least 2 or 4 megs on your ST to be able to use it, until a third-party (the original was developed by the same people who brought you Calamus in their early days) developed a new printer driver for it.

If anyone has any corrections to this info, feel welcome to post.
:-)

For me it sounds like the Flyback is gone. I have had this twice with my
TTM195.
Bradley Koda of Best Electronics give me a useful tip to see if the
Flyback is still working.
If you turn on the powersupply and hold your arm next or near the monitor
you should feel your hair raising up on your arm. If this is the case then
it's probably something else.
>
>Is there one thing in there that usually blows?

Another weak point is the connector that connects the motherboard with the
screen bulb. I had to replace that connector because it was completely
melted.

Does best Electronics have it?

I don't know if he still has these flybacks in stock.
A final note to end this mail: the flyback is rather expencive. I think
it's around 110 USD.

Those kind of monitors usually have sync on green line. There are two possible solutions; mix-in sync in green or hack with the monitor guts to see at which point sync is separated from green line, cut the connection, mount extra BNC and connect it to new sync input. It might be easier than one thinks as some monitors have internal provision for it already (switch and connector).

:It just started happening . I found yesterday the power supply voltage
is
:pulsating so I removed the power supply put in a working power supply
and the
:same thing happens. All chips have been pulled then cleaned and
reseated.

Attach a harddisk, the bombs may disappear. In that case your computer
thinks
it has no diskdrive. You'll need to check your diskdrive, maybe with
another
system. It could also be a buffer circuit, 74LS06, which frequently
gives up
breath on 1040:s. Just snip it off and replace it with a new one (and a
socket).

Alternatively you could check your sound chip, the DMA and the FDC.

Good luck!

Hello,

I was wondering if there exist a program that turns the Atari into a
SCSI analyser?
Such a program would have to run from a IDE disk and bypass the TOS
driver, but it should be possible using the Atari SCSI chip to eavesdrop
on the SCSI bus.
Anyone an idea?

John,

As someone already noted, the flyback transformer is the usual
culprit.  I seem to recall that Systems for Tomorrow was selling a
TTM195 substitute for a very reasonable price ~$200 US I think.
Maybe that would be the way to go.  In the meantime, do you have
access to a VGA monitor?  You could always use that while waiting for
repair or replacement of the TTM195.

You can take your STe up to ~14Mb with a board from Aixit in Germany - it
takes a single 72 pin SIMM.

If the problem is intermitant, reheating the connections around that
transformer with brand-new "hi-tech" tin (ie: 5% silver based) will
usually fix it.  Otherwise, some power transistors and that transformer
might need replacement.

Bernie Diotte (a former Atari shop owner in Trois-Rivieres, Quebec)
has found a fool-proof method of fixing this.  E-mail him at
berny.diotte@sympatico.ca if you want him to fix it, within America.

I was wondering if it was possible to connect a mono jack to the
Falcon's speaker output connector. What I would do is remove the speaker
and solder the 1.4" mono jack to the wires

I would like to have mono out to go directy to a keyboard amp or a
mixer. The DoitF030 files say that the internal speaker is 8 Ohm.

I also seem to have problem with the stereo headphone output: the right
channel seems to be dead. Any ideas ?

Cheers,
Nick

Although not exactly what you are describing, ICD - on their
scsi pro HD software had a package called scsi-if I remember
correctly.

It allowed you to prepare scsi messages and send them to the
scsi bus and to receive messages back. The preparation,
addressing, etc were done primarily from menus so it was
pretty straightforward. It would display the received

response to what had been sent. It may not be as fast as
what you are after but it sure let me learn a lot about
scsi and enabled me to chase a problem I was having with
my Texel scsi cdrom drive when it first came out.

I think the software, as a proof of concept says yes - it
definitely could be done.

Just a thought: have you checked the Sound CPX? There is a setting in
it for the stereo balance, and maybe you've set it towards the left!

Cheers!

James

hello is it a multisync 3d, if so, i had exactly the same problem, i dont know what causes it yet, but when i do you'll be the first to know about it, its bloody strange, it happens when i turn my falcon on sometimes, but all i get is a strange squiggle on the resolution, i have to reboot falcon before it workx,

Dave

have you plugged a mono jack in to the headphone socket it would only
give you one side

why not try a small stereo to two 1.4 mono lead and use 2 inputs on
the amp as most music has 2 sides

Try jiggling the plug and see if the left goes dead and the right works. My Falcon has the same problem unless I put the plug in just right. I guess its a bad jack. Then again, all of atari's jacks were always slightly off. My STe's RCA jacks are slightly smaller than standard and I've used a lot of different cables. The same for the RF out on both the Falcon and the STe. My mic jack on the f030 is also slighty out of whack.

I've no idea if this works or not - but IIRC someone mentioned much earlier
that it needed special drivers.

>If anyone has any corrections to this info, feel welcome to post.
Nice summing up.

There is a software solution to this problem however. You need the printer
and its ST together with a null modem connection to the Falcon/Mac/PC. At
the client end you print with an HP laser/deskjet driver at 300dpi to the
serial port (also possible to do the transfer via disk if preffered
depending on what the driver can do).

At the server end, an accessory is called which receives print data and
outputs it to the SLM via the Diablo emulator.

This all works but quite slowly as you can imagine.

Read my review of this in Atari Computing magazine and surf to the URL in my
sig to pick the software up.

THX for your answer.
Is it also possible to receive messages from a device on the SCSI port,
without that you send a message first.
I need it for this purpose :
I want to connect a SCSI<->Ethernet Adaptor. So I need to know the
messages I receive from the adaptor, without first sending to the scsi

adaptor?

Diablo? Come on there are newer emulators than that, I recall.
And a slow serial connection? Perhaps it would be better to buy a second
hand ST,
connect the SLM and use a MIDI-network or something (yes I know, that too is
serial,
but works a lot easier than using a Null modem, I think).
I really have to look up those old mags. And yes I even recall a review of
the
Heatseeker in a Dutch mag that reported that it was pretty damn fast and
had a thru port for other DSP expansions as well.

But maybe I'm completely wrong. I'll look it up as soon as I find time (I'm
moving).

The Fuji lives :^)

Indeed you can, there may be a problem with the level being too high though
(use the sound cpx to turn it down).

Using a switched socket would mean that you could still use the internal
speaker until you inserted the plug (I for one have unplugged the speaker
altogether and am using a pair of external speakers in the headphone
output as it happens).

>I also seem to have problem with the stereo headphone output: the right
>channel seems to be dead. Any ideas ?

Assuming that you've tried the other suggestions given then I'd be inclined
to check back from the socket's connections with an earphone to find where
the signal's OK.

You TT users that need or want Moniterm monitors, very inexpensive,
should check out the Department of Defense DRMO auctions. Here at
China Lake, Moniterms are going out by the truck load. Some of the
bidders I guess didn't want them and dropped a few off at the local
thrift store. I got one for $5.00. (no more there now). The China Lake
DRMO recently shut down and has been transfered to the Barstow
(California) location. They are nation wide. Do a web search and see
if one is near you and attend an auction. You probably have to buy a
pallett of stuff, but it's usually pretty cheap.

The utility uses the Diablo's graphics printing routines, nothing more than that.

Possibly, but you'd have to rewrite the accessory! :-))

I'd suggest transferring files for printing by printing to disk, the utility will take such a file as its input - or possibly upgrading the STFM's serial port with the RSVE mod.

All in all the best answer is still a laser connected to the printer port of the other computer TBH.

Yep, they have the same format. But i'm not sure in this moment
whitch contacts in the plug are connected while use a mono plug.

(Watch out for shorten both stereo channels)

I'm not testet a mono plug before!

>I would like to have mono out to go directy to a keyboard amp or a
>mixer. The DoitF030 files say that the internal speaker is 8 Ohm.

Right, 8 Ohm

Remove internal speaker. use J12 on the mainboard.
Connect two wires, fit a 3.5mm mono plug backside falcon.

You got mono out with only one hole in plastic :)
Saves the stereo headphone out..
Do not create a short ciruit with both wires..!

>I also seem to have problem with the stereo headphone output: the right
>channel seems to be dead. Any ideas ?

Yep, that's mostly a problem of the mainboard connector.
If not, you must check some smd capacitors and a lot of other
components up / down side mainboard. Mostly i found bad capacitors..

In 4 years only one falcon with an defective amp.

DOITF030 contains the way to repair IN and OUT channels, but it's in german..
Hard to translate all.. :/

Regards, Robert

Hmm, the thought occurs to me that I could use Magic Sac to transfer
files downloaded from the inet from my ST to my Mac Plus. The Plus is
a real pain to get programs for without a terminal program since it
only uses 800k disks which TMK there are no transfer programs for the
PC . Has anyone ever tried this ?

Hi,

I want to backup my Minix partition of my Falcon on my (PC) Linux box.
I plan to do this through NFS. What I want, is to run an nfsd/mountd
on my Falcon, and then mount the Falcon's filesystem on my Linux box.
Is there an nfsd/mountd for Mint available (and _where_) ?

As a second solution, a mount utility for Mint to mount my
Linux filesystem on the Falcon through NFS, would be an
alternative. But I *really* would do the opposite (Falcon server,
PC client).

Anyone can help ?

Greetings,

Both will work, get the NFS-package from e.g. ftp.funet.fi/piwo-mint/

Hi!!!

In about 12 months or so, I will be in the market for a falcon.

What exactly are its specs? And a few questions
here:

1.) Max memory?
2.) Is the HD SCSI or IDE?
3.) What type of monitor
4.) Accelerators available?

Thanks,

Jim W. Krych

I have a 670c (pretty similar to the 690), and I modified the
550C-driver to use the 600dpi-modes. I don't have access to my Falcon
right now, but if there's any interest in it I can write down how I
did it later today.

Can you get another modem (and cable) so you can test what's bogus? It's the modem, cable or Mega. If it turns out to be the Mega ST, then check all softwares, does it flicker if you boot without HD/diskette?

If the modem and cable has been prooven good and it does, you have hardware problems and the Mega ST needs a check.

Oh, please do (if it's not a big job to do...). Never know when I need
to print something nice! No hurry with this, though... take your time.
I have never tried to do any colour printing on the Falcon. Does that
work out OK?

Thanks for all replies!

Hmm, my news feed is down, have to post via DejaNews -- Aaargh!
Anyway...

OK, I was wondering about the parallel port situation on the Falcon... I know that the thing is bidirectional (ie. capable of sending data over the data lines as well as receiving), as was the ST centronics port. I also know that it has two extra lines: Strobe (out) and Busy (in), which are also available on the ST and can be accessed using the PSG and the MFP respectively. But now comes the difficult part... According to my Falcon manual, its parallel port also has the two lines Ack and Select. But I haven't heard of a way to access these! So what's the beef? Are they steered by the hardware, and if so, how? And if not, how

can I access them? Anyone?
Thanks,   -=Levien (lvzon@bio.vu.nl)

Unless you have a Milan (or maybe a hades but i'm not sure of this) you
simply can't because some signals are missings on the // port...
If you have a mialn it'll work BUT you have a little thing to do before:
Write the Driver!!

Regards

Olivier

Nope, if you use RTS/CTS, they need to be swapped. To get my link working (ST to Acorn) I needed to swap TX/RX, RTS/CTS and connect the DCD on one machine to the DTR on the other. This was the only way for me to get the link established.

Im having a problem with my Mega STE. Everytime I turn it on it Bombs with 4 bombs. Which is Illegal Instruction. So what would you say is causing it? I have changed all the memory but, same results.   Any help will be appreciated.

Thanks Don

> usually cheaper to buy a ready made cable.

No that's very wrong. Only crossing TXD and RXD and connecting the other
lines straight overloads the serial ports, causing it to break eventually.
CTS and RTS must be crossed too. DTR from one end goes to both DSR and DCD
at the other end.

Cheers  Peter

: 8 Mb of ST-Ram in addition to what's already on the TT motherboard.

If you really want a lot of ST ram, there is a way to put 8 megs on the motherboard. Best Electronics have the 1 meg by 4 chips necessary, the other chip needed is a 300 ma non-inverting buffer chip, and a 43 ohm resistor. Then, adding an 8 meg board gives 14 meg.

I have most of the chips, and wire, and skills. Have not done it yet, though.

It is not expensive. When and if done, $34 US in outlay.

Don't forget that it's not that difficult to write your own printer
drivers for NVDI, though I don't know if they can be written for the
higher resolutions.

Does anyone know what modern inkjets work with the printer drivers
supplied with That's Write 3?

A hard disk is never a good backup device. Backup up data doesn't mean to have a single copy but to have several backups, not all of them at home but at another location in case something goes terribly wrong. Backups mean a secure way of storing data required for an emergency case. Simply copy them to a hard disk drive and only having one copy is not secure at all.

By definition the generic SCSI driver provides _generic_ SCSI support.
Other drivers make use of this driver to access SCSI devices. These
drivers (like GEMAR for streamers, SPIN! and some others) don't have
SCSI routines of their own. They use HDDRIVER to send SCSI commands
instead.
GEMAR is probably what you need if you want to make backups on tape.

You can easily check this. Titan don't get their HDDRIVER from me but,
as far as I know, from WB Systemtechnik in a bundle with the LINK97. So
your driver disk should have a label by WB Systemtechnik on it. If not
...

NVDI from V4.11 has a specific HP660C driver which offers 600dpi in mono
and greyscale modes.

>I have a 670c (pretty similar to the 690), and I modified the

I did this too before upgrading NVDI, it's a matter of adding a new
resolution to the 550C driver using makeprn and copying the 600dpi codes
from one of the HP laserjet drivers.

You can do something similar with papyrus.

Data 8..7, Strobe, Busy is good, but I was first confused about ACK and SEL signals on paralell port, so I decided to explore a bit. In my Book (it's about ST-STE-TT only) says that some printers have an ACK (acknowledge) signal, and they are low when the printer says to computer: hi, I received data all right!
Sorry, as I said, I do not know how to access these on Falcon, I want only to share this amazing discovery of mine with others. :-)

Bye, Tom

I have the following for sale. I want to sell it all together since the monitor is made for the TT030.

Atari TT030 w/ TOS 3.06, 4 Megs ST RAM, 40 Meg SCSI HD, 1.44 floppy,
keyboard, and power cord.
TTM195 High Res. Monitor(19"), w/monitor cable, and power cord.

$250.00 (US) plus shipping(buyer pays)

Both are in excellent working condition. Buyer pays shipping cost.
Checks: will be held 7-10 days before shipping merchandise. Money
Orders: merchandise sent right away.

Contact me at dons@qnet.com

Thanks Don Schoengarth

I am not sure what the problem is ... but, these are the symtoms..

Will not read floppy drive or internal SCSI HD or external HD at all. A friend put a diagnostic board on the computer and it said something about MFP not responding or something. Everything actually worked once during

the testing, but then failed again. Does anyone know where the MFP chip
is on the computer? I would like to try and reseat it before sending it
off for repairs (wherever that might be!) Any help is appreciated as I
really want to keep the MegaSTE to run Dr. T's Omega MIDI program.

Thanks,
John Norton

I had some terrible problems with Gemar 3.06 and an EXABYTE.

See thread "ATTENTION: Gemar 3.06 destroys older backups".

Finally I found out why: the EXABYTE streamer was a bit dirty (it
was already used before) and so the EXABYTE stopped doing
backups and showed a "CLEAN"+"ERROR" very shortly (I've not seen this
error at first because it only lightens up very shortly at the device
and I was staring at the screen wondering why it all stops-
Gemar error messages are rather "non-specific" in this case).
Gemar obviously cannot handle this: it ended up in some endless loop
with a dialog "... Check condition (DEVICE RESET, ...)" and it was not
possible to get out of this dialog and end Gemar. I had to reboot.

The latter obviously corrupted opened dirs/files on my HD.

After cleaning the tape drive with the corresponding cleaning tape
it was ok again and since then backing up seems to work.

But for more than 2 weeks I was without correct backups which
may result in data loss.

I tested the cable with an ohmmeter and it seems to be ok
(it's a new cable and therefore shouldn't...
...but you never know).

> It's the modem, cable or Mega. If it turns out to be the Mega ST
> then check all softwares, does it flicker if you boot without HD/diskette?

-I tried to boot with the HD off: no flicker.
-I booted without any acc and without any AUTO program from HD: no flicker.
-When I added StinG into the auto dir, the flicker started again.
 I tried switching off the "Active" in the appropriate CPX
 and booted: no flicker, but as soon as I switch STinG
 active again, the machine bombs right away.

So I guess that I have to check my settings for StinG and check the
appropriate FAQs.

At least now I know that it is not the modem, the Mega 2 or the cable
alone.

Both modem ports use a 9-pin connector, but are driven by different chips:

Modem-1 uses an MFP like the ST  (19200 bd maximum)
```

Modem-2 uses an SCC like the TT (230400 bd maximum)

Modem-1 is assigned to the same BIOS device as the ST's modem, so the
Export can be connected there, using a 25-to-9 pin serial adapter.

Damned, I should have thought of this earlier! You've set up STiNG so it
thinks it has a serial cable connection, a route trough a null modem cable.
Remove all routing and you should have just a default one left that'll work
as dialup. I'm in a hurry so I can't give you better description, but I
remember having flickering too when I had routing set wrong.

Regards, K.Hampf

It bombs after it checks the memory. Then it pauses for 5 secs then bombs.
It does have a floppy attached but, no hard drive.

the other day I hooked up a moniterm monitor to my Falcon (duh!)
problems! now my Falcon video signal appears to be screwy.
I hook my NEC multisync up to it, and see a black screen when I boot the
falcon, then I turn the monitor off and on again and I see a signal of
horizontal lines scrolling down my screen which I can not adjust so that
I have a 'still' image, also the Atari logo flashes on briefly, and some
interference is seen before the screen clears again (other than the
rolling horiz bars), then there is some interference again, maybe opr
maybe not the Atari logo briefly...yada yada yada
It appears to me that hooking up the moniterm did some nasty thing to my
sync. would it be the videl chip?
thanks for any help

I forgot to say that the floppy drive light does not come on when I

first boot, but when I turn the NEC monitor off then on the floppy
drive light comes on but that any disk I put inside does not seem
to be accessed! the falcon does not boot (obviously I see nothing on
screen! :^) though I do hear/see drive activity.

 Hi all
here is a list of games i got with an atari clearout i bought mainly
for the hardware and serious titles,ideally i would like an offer for
the lot,good singles,but no one pound for this or two pound for that!
99% are in original packets but as i don't do games i can't
be certain all disks are there

hard nova 2 disks + 3 big old floppys
encylopedia of war
f16 combat pilot
virus
pipemaina book no disk
barbarian 11
escape from the planet of the robot monsters
federation of free traders
falcon f16
kingmaker
microprose golf
campaign

air bucks
flight of the intruder
tank platoon
fire brigade the battle for kiev
battle command
blue max aces of the great war
wolf pack
their finest hour
special forces
the midnight oil divison one 92
fun school
kick off 2 + return to europe
pro tennis tour
manchester united europe
pacmaina
rick dangerous
advantage tennis
street fighter 11
great napoleonic battles
cohort 11
civilization
east vs west berlin + audio casette
strider
discovery in the steps of colombus
sensible soccer
sabre team
barbarossa the great patriotic war
football managers
ghouls an ghosts no book
hexx pc game
advanced dungons and dragons pc game

Aha. The port is not just set active, but chooses PPP too, right ?

The flicker then is STinG sending PPP negotiation packets.

Switch the port off by unchecking the Active crossmark, then save the settings.
Problem should be gone. For logging into an ISP, the Dialer does the activation anyway.

>> and booted: no flicker, but as soon as I switch STinG
>> active again, the machine bombs right away.

Are you sure you got the latest version of STinG ?

Cheers Peter

I see that the ste has what looks like 30 pin simms already.
Will any 1 meg simms work or do they need to be of a special type?
I have heard that the standard ste was 1 meg but can be upgraded to only 4 megs is this correct?
Thanks for any help here.

Yes any 1 meg simm as long as the pin numbers are correct.  Look
around, you can find the simms for as low as $5 usd per meg.  4 megs
for $20.  That was just the sales tax back in 1990 when I made my STe
into 4 megs.  $60 per meg.  Boy have prices come down.

Why? The modem cable has a male and a female end, does it not? The ST
is male and the modem is female, IIRC.

This is in the Quick FAQ. Standard STE was either 512K (2x256K) or 1024K (4x256K). In any case the 256K are useless.

Replace them with 1Mb SIMMs, 30 pin, speed under 120ns, with or without parity. Yes, that means just about any 1Mb 30 pin SIMMs.

Details in the Quick FAQ.

Cheers,
Nick

If your atari has a double sided drive, then you should be able to
format DOS compatible 720K disks on the Mac and use them on the Atari.
This doens't work for some people though.

> how can i get software for the atari???

On the net or from a dealer ? Check out the Quick FAQ for FTP sites.

> how can i translate it from my mac to the atari??

There's no "translation" involved. Copy the files over to a DOS disk.
Unzip/Unlzh them on the ST.

> can i network my mac with the atari 520?

It's possible, but difficult.

You can however use a Zmodem compatible terminal program on both
machines with a null-modem cable. This will allow file exchange between
the two machines.

Cheers,
Nick

Not directly. However, there is, or at least was a mac emulator for the Atari ST (can't remember it's name) that actually runs 30% faster than the old Macs. You need an external floppy disc drive though. The emulator plugs into the cartridge port, the floppy disc plugs into the cartridge, and the cartirdge also plugs into the floppy disc socket. ie. the translation is done in the emulator.

> how can i get software for the atari???

You could also (I asume) make up a NULL modem cable (there is a thread on that just now) and trasnfer files that way, using Kermit or similar protocol software.

> can i network my mac with the atari 520?
Don't know.

Gav.

This is Spectre GCR. VERY difficult to get nowadays. So difficult that I wouldn't even mention it.

You can theoretically exchange data between the 2 machines with DOS disks.

> You could also (I asume) make up a NULL modem cable (there is a thread

Or just BUY one... All this discussion about making a null-modem cable is rather silly IMO. You can get one in just about any computer shop or supermarket for your local equivalent of US$5 or 4 Euros. My time is worth more than that.

Cheers,
Nick

That sounds like the Spectre. It sits on the cartridge port and has a cable which plugs into the external floppy port: SFAICS it uses this to directly control the *internal* floppy (the Mac reads and writes floppies in a completely different way to TOS/DOS). So you don't need an external drive, but you do need an internal drive and an external drive *socket*. You also need a set of Apple ROMs and a version of MacOS (up to about System 6.0.4). With that you can read and write Mac 800KB floppies (same media as TOS/DOS 720KB), but not the 1.44MB jobbies.

The Spectre is no longer made: second hand ones turn up from time to time.

In principle you could run STiNG on the Atari and MacTCP/MacPPP on the Mac, and use the Mac to telnet/ftp to the Atari. But if the 520 really only has only 0.5MB of RAM then I have my doubts about that.

I've finally figured out how to access the SelectIn and Ack pins on the Falcon... The Aura docs seem to be the only place that document this online. The Ack pin is read from the second I/O register on the MFP (where the ring-indicator used to sit on the ST, IIRC) and the SelectIn pin can be set using one of the PSG registers (can't remember which one right now...) I think I'll write some proper docs on using the parallel port on the ST/Falcon, as documentation is very hard to find and there are a lot of misconceptions on what especially the Falcon port can and cannot do... Keep an eye out for more docs at http://atari.scum.org/

Greetz,
         -=Levien (lvzon@bio.vu.nl)

I hope you realise that this is definately frowned upon to post files into Newsgroups.

Quite frankly, in view of your attitude against spammers, the fact that you're basically spamming files into Newsgroups, forcing most people to download these files, (thus increasing their phonebills) is selfish in the extreme.

Why don't we all take your advice, and fill up your email box with large files??

Thanks for replies on the ram. Found the 4x1 MB 30 pin in the old computer junk box.

The next project is to add a disk drive to my STE on the cheap.
In the FAQ I found this remark:

Atari SH drives have the advantage of being made up of an ACSI to SCSI host adapter connected to an Adaptec 4000 SCSI to MFM adapter that is attached to the drive. It is therefore sometimes possible to adapt these drive to use SCSI drive mechanisms.

Does this mean that if one can locate a worn out atari SH drive then one could remove the old drive and attach a new SCSI drive after removal of the adaptec 4000 SCSI to MFM adapter?

Thanks for any info.
Devon Carter.

I have an old 520ST with an SF354 drive. I opened it up to clean the head, and I noticed that it works using a rubber belt from the motor to the platter. I'm having trouble formatting and writing to disks. Is a worn/stretched belt a common cause of this in these drives?

I know this question gets asked occasionaly (and I know it seems more like a PC question) but you never know what new utility may be out there.

I have the last version of Pro24 (ver 3) which saved files in .sng format.
For some reason it always had problems converting these files to .mid format,
and now that I'm having trouble saving files with my drive it's not likely I
can do this at all on my ST.

However, I can get these .sng files over to my PC using st2dos. So, the usual
question: is there anyway to convert the Pro24 .sng files to .mid on a
DOS/Windows PC? (I realize that there were several ST sequencers which used
.sng as their format, but I believe they were all different, right?)

I have read that you could change the .sng files to .all format using the ST
version of Cubase, but what about the PC version?

As far as palmtop PCs go, as long as they are DOS compatible and have a
serial or parallel port then it's the same as with any PC: ghostlink,
parcp, paralink, Zmodem...

There is a page somewhere that deals with connecting the Atari to a
PalmPilot or to Psion S3. Do web search on that.

Cheers,

Nick

Rubber as everything else is exposed to ageing, and 10-15 years is a long time for a computer device. I have belt problems regularily with record, tape and video players, but up to now no problems with disk drives.
If you pull the belt and it doesn't easily return to it's original position, it has lost it's elasticity.
You should still consider to purchase a double sided drive, if you find one.

Cheers,
Wolfgang

Hi,

Does anyone know of anywhere in the UK where I could get hold of a RAM
upgrade board for the ST ? - I've got the simms, just need the board,
......oh, and a SCSI host adaptor too.... (once again, got the drive,
need the H/A !)

I've tried searching the web, but find nothing in the UK.

Many thanks in advance,

Cheers,

Kev.

    It is possible to Run Minix on the ST.
    There was a commercial release of this and I have a copy
    (original) if you are interested. Minix upgrades are still
    available on several atari related FTP sites.

TUS (The Upgrade Shop) do both. See their advert in Atari Computing
(What.. you don't subscribe?...shame on you). Alternatively pop down
to the Atari show this November.

Saif

>
> Do you have to have a hard drive?
> A minimum amount of RAM?

You can connect through PPP or SLIP with only floppy and 256 kB RAM. You will have trouble to really use it though. This means, the Internet connectivity does not set the requirements. It's only the applications.

Consequently, it only depends on what you wanna do. If all you want is Telnet, get TelStar, and it will probably still work with the minimum setup of 256 kB. If you want full grown Web browsing, you'll need 2 MB as a minimum, and then a hard disk is very desirable. For Mail, NEWS, FTP, IRC, 1 MB is enough to get into the game.

> What if all you want is text-based, does that change anything (soft or
> hardware)?

Taking out www, I'd say you need 1 MB. Hard disk desirable but not essential.

However, many ISPs allow logging into a Unix account where you can invoke text based net clients. For this, which does involve neither PPP nor SLIP, a basic terminal emulator suffices. CoNnect, Rufus etc. do the job. Dunno how much RAM they need, but 1 MB should be fine.

Cheers Peter

PS.: This question is asked again and again here, so I assume it's not in
     the "Quick FAQs and other source"s. Maybe it's a good idea to include
     this answer in those ?

Dear Madam, Dear Sir,

After technical problems, we are pleasured to announce you the OFFICIAL OPENING of our NEW WEB SITE.

www.centek.fr

If you have already visited our site, we propose you to come again.

Except the technical problems we have corrected (NETSCAPE is now running !), some new informations about the CENTurbo II are available:

- new benchs of the CT2 versus the TT030 and the ST wich will allow you to realize the difference between the CT2 and your computer or the new machines...
- hardware informations for the hardware and software designers and the others, especially a very simple 'block diagram' to understand what the extraordinary power the CT2 brings to the Falcon !

News PHENIX informations will nextly be available, but we want to confirm you that the number of PCI slots is THREE, not TWO ! The new file 1.3 corrects this error.

Don't forget to have a look on the 'NEWS' about the DSP 56301 card and the new management of the IDE HDD by the CT2...and on the new software 'V-TRAX'.

ATTENTION
Caused by an external technical problem, our e-mail centek@graphity.fr stopped to run correctly the 10th July.
If you have wrote us after this date, please send us again your mail at vxp@imaginet.fr
We will answer you as soon as possible...

Yours Sincerely

I reinstalled a Nemesis on my Falcon/ Mighty Sonic, and found a problem with the latest release of MiNT. If the program in TT ram flag is set, MiNT will not load. Fast load and TT ram for memory is ok. I had been running V1.15 on the Mighty Sonic in fast ram without the Nemesis no problem and it works on an Nemesis-A/B setup without problem. I went back to V1.14 and all works well again. I didn't notice anyother problems with operation other than MiNT won't run from fast ram itself. Even with the Nemesis.PRG removed (cookie installer) the problem exist.

What is V1.15 checking in hardware that installing a Nemesis could effect?

Mike

There are two modem ports (modem 1 and modem 2) and they're both 9 pin. Modem 1 is restricted to 19200 baud, but modem 2 goes up to 230400 (?) so would probably be better suited for MIDI. There's also the serial 2 port which I believe is also high speed. This is also a 9 pin connector.

I don't know too much about the LAN port except that it's a round connector about half the size as the MIDI connectors.

Never mind. I somehow got hold of the beta during all the work. The
V1.15 file size 186,331K works fine.

MG.

Hi

I'm after two cover disks from the Amiga & ST Format magazine, the mag before they split; issue 2 & 4.

Either the physical disks, or sent via email.

If sending by email, can you please send it to this address - AtariST@usa.net - this will allow me to collect it via my Atari. Please let me know via emial that you have sent it so I can go and fetch.

Thanks, in advance

Me too: it was a Genius mouse. It had a selector switch, and a special cable
that you had to plug into the PC and then the mouse. Maybe an adaptor cable and

some IKBD software might do the trick (I think the PC mouse sends position- and button-change info via 3-byte serial packets at something like 2400 baud.) Could the IKBD be programmed to interpret this?

I reinstalled an EZ 135 IDE drive in my Falcon. I removed it before as it took several tries to get the device to spin-up. At the time I thought it might have been the stock powersupply not having enough umph, but now have a 75 watt supply installed. It still takes four or five reboots to get it going. Works fine then. I don't see a delay spindle start jumper or the like. Anyone know if it might be a firmware setting I have to change from a dos box? (using HDD V7.56).

Thanks,

Mike

Hallo!

Wie kriegt man denn einen modernen Tintenstrahldrucker (z.B. Epson
Stylus 300, 400, 600 usw.) am Atari ST zum Laufen?
Wo kriegt man Treiber her?
Braucht man au�er Treiber und am Parallelport anst�pseln noch
irgendwelche anderen Voraussetzungen?

Da ich noch keinen Tintenstrahler besitze, k�nnte ich bei der Wahl des
Modells auch bzgl. Verf�gbarkeit von Treibern leiten lassen. Welcher Typ
ist zu empfehlen (Voraussetzungen: 720 dpi reichen v�llig, < DM 300,
getrennte Tanks f�r Farbe und SW)?

F�r alle Tips bin ich dankbar.

Bitte per Mail antworten!

Ciao,

    Andreas

Behne & Behne.

>Braucht man au�er Treiber und am Parallelport anst�pseln noch
>irgendwelche anderen Voraussetzungen?

230 V/50 Hz electric currency.

>Bitte per Mail antworten!

Nope.

Dear Mr. Liebscher. It would be greatly appreciated by me and the rest of the world if you visit de.newusers.infos and news.announce.newusers before posting again. This article goes to international newsgroups (comp.*) in which English is the language used, to a BBS hierarchy (z-netz.*) to which crossposting is not advisable, etc., it has no set Followup-To: line to one single group, which is highly advised, and it has a line in it that is hated by any Usenet regular, for asking for mailed answers shows that you don't even read the groups you are posting this to.

Thorsten

Addition to the above:
I found out, that some directories on the
partition that I tried to backup with Gemar 3.06 are now corrupted:

When I try to open the directory, the Mega 2 crashes and resets.

And these would be pirated software, isn't that illegal??????
This is something I'd expect from Amiga owners. Amiga owners would prefer to pay 3.50 per disk for pirated software than pay 2 pounds for the original!!!!!!!!

When partitioning a disk with Uwe Seimet's utils, is there a way to determine *which* partitions will be extended? I haven't found one.

I'd like the first, second, and last partitions to be "real" (one each for TOS and NetBSD to boot from, and one for Spectre).

Hello,

I'm coming to the point where I need to know,
which technical device is best for backing up my data
from HD.

My config. at the moment
Mega2->ICD AdSCSI ST-> Seagate ST1480N HD (SCSI Id 0)

Since the Seagate ST1480N has a bit more than 400MB
I'd like to have a fast (and cheap) backup device (SCSI I'd prefer).
Best would be to access the new media as a normal disk
and simply use filecopy.

At the moment I'm testing an EXABYTE 8700 and obviously
this is not the best way
(problems with Gemar 3.06, destroyed backups, corrupted files...).

What would you use?
Zip (Iomega?) ?
DAT?
CD-RW?
Wait for DVD (as a complete overkill...)?

Thanks for any answers.

The a Zip or Jaz seems to be your best choice. I'm using a Zip for
backup myself, and with tar/gzip I can fit 400Mb on two disks.

> Zip (Iomega?) ?

Recommended.

> DAT?

Ditto, but DAT is slow and it's harder to read the tapes on other
hardware than using a Zip (I have both, but both my two DATs have
died so there's no chance in recovering the data...).

> CD-RW?

Definitely not.

zip is noisier and slower than the syquest drives and I've seen some complaints of dead drives popping up every now and then on this news group. Syquest's SyJet gives me 12ms access so is almost as fast as my hard drives. 1.5G lets you store multiple 400M images if you wish on the same disk. And they come in scsi versions. And lately their price has been down making them quite attractive - but it might not be within the "cheap" you are looking for.

You can easily find this out somewhere on the net, perhaps even in the Atari FAQ's.
If I remember it correctly it's a standard serial (modem) cable with the transfer (TX) and receive (RX) pins switched at one end.

I need to find the original ST-Ram card from Atari, which provides
8 Mb of ST-Ram in addition to what's already on the TT motherboard.

E-mail me the details and your price, if you have one for sale.
Thanks.

The first three partitions (or four, if there are not more than four
partitions) are always non_extended. There is no way to influence this.

I would use (and actually do use) a phase changer drive. They are cheap,
the media have a capacity of 650 MByte and additionally they can read CD

ROMs. So you have two devices in one for a fair price.
Basically you should use a backup device that guarantees that you can
put all your data on a single medium.

A ZIP doesn't make sense when you have to backup 400 MByte of data. This
means that you need 4 media for a complete backup. This is quite
expensive and it's complicated. You have to think about how to
distribute your data on these 4 media and you have to change media
several times when you backup your data. This is no fun and the result
will be that you don't make a backup as often as you should.
I recommend a backup solution where all your data can be saved on a
single medium.

And CTS crossed with RTS, and um DSR with <foo> and <bar>, and a couple of things like CD grounded ... damn, I used to know all this stuff. :< Like Kerry says, search the www. Or buy a cable. ;>

I would normally agree with you (I used DAT myself until it broke),
but since he wanted a fast SCSI-device that can be accessed as a
normal disk I would recommend a Zip (or similar, like the
Syquest-drives). It's reasonable fast (about 1.2Mb/s on my Falcon),
cheap (the drive, not the media) and the most wide-spread removable
media today. There are other options (the phase-writer devices you
mentioned), but Zip is still the only thing you can buy everywhere and
expect to get disks for in five years.

The best backup-device is ofcourse another harddisk, you can get a 2Gb
SCSI-disk for the same price as a Zip with a few disks.

Bother: I was hoping that the first two and the last would be. (Dunno why,
that must have been the default with something I used once). Fortunately
my third and my last partition are of similar size, so I'll just swap the
functions around (Spectre partition needs to be non-ext, NetBSD swap doesn't).

Thanks for the clarification, Uwe. BTW I got my current HDDRIVER from Titan,
I hope it's legit..

I have a DAT drive, which would be great (2GB on a single, cheap, medium)
were it not for the fact that Diamond Back regularly ^&*%s up on restore.
I've been wondering whether the "generic SCSI driver" incorporated into
HDDRIVER opens up new possibilities here: for example using GNU tar under
MiNT?

Checked with an ohmmeter.Is ok.

> Use HSMOdem7 as serial driver on your atari.

I already used it.

> Switch on RTS/CTS !

Done.

> I think this is not a problem of STinG/CAB, maybee driver or cable..

The problem remains:
HS, DSR, CTS, EC- LEDs of the ZyXEL 1496E plus are on
and TxD and RxD are flickering.

Is it possible that the ZyXEL is in some strange mode (FAX?) where
it tries to send something to the Mega2 (which of course fails)?

ME

Do you have some quick pointers where to buy?

Local dealers seem to be clueless, where I can get it.

No, it's just TX/RX which are transposed. But you're right - it's
usually cheaper to buy a ready made cable.

Gee, it would help wouldn't if the site was actually in *English*. Not that I'm discouraging people from keeping the old systems alive just because they don't do it in English, but it seem a bit inappropriate to be posting the URL of a non-english website to a predominately english speaking newsgroup, since most of us won't be able to understand it. ;-)

Hello.
Is there a suitable driver for Mega STE/Falcon to use a HP690C deskjet
printer or do I need to upgrade my NVDI to the newest version? I have
been using a HP500 with Papyrus & Atari Works for a long time, but now
it decided to leave this world permanently. I got a good offer on the
HP690 so I decided to get one if it can be used with minimal problems...
Thanks for the info!

Generally, the drivers for HP-500 and HP-550C work with the HP-690C (with may be some problems with older Speedo drivers ?), but you wont' be able to use the 600*xxx ppp modes.

For a specific driver, I think the only solution is upgrade NVDI.

If memory serves me right, in Mega STe there is a whole bunch of chips in sockets. This could be the case of contact oxidation. PLCC and such are especially vulnerable because of small contact area between IC and socket pins. He could try pulling PLCC chips out, gently brushing (chip and socket) contacts with something like fingernail brush and reseating them.
One could also slightly bend socket contacts to press harder at the chip (use a needle), but it can lead to breaking of the socket pin (well hardly but possible if one is drunk and nervous).
Contact oxidation often happens with ST's GLUE and MMU chip (without a blitter these are only PLCC chips in ST!).
Then again, it could be million other things, from broken metalization in PCB to bad PSU...

Regards,

Branko

--------------FB57DCC84C0BA7C1CBE90528
Content-Type: text/plain; charset=iso-8859-1
Content-Transfer-Encoding: 8bit

i've plugged a 16Mhz CPU in my 1040, plus an own
TOS2.06 upgrade.
the machine starts booting, gets the atari logo,
even loads a boot-sector
with time-set input from floppy, but crashes at
random places and never gets to the
desktop - keys will be read right and i even got
the mouse once working.

- so i cant tell: is some chip (eg. the ACIA now
on 1.6MHz) to slow ?
- the RAM are the 4MB from the F030, this is
sufficiently fast enough.
- are the soldered lines maybe "too long"
- like in the C't article (10/91) maybe the
Sound-chip gives a too long -DTACK ?
- i have the IMP chip-set in my 1040

```
with my oscilloscope i cant get a stable
crash-point (buss-error) cause they vary.
furthermore i had to invert the 16MHz clk to get
some "results" at all ...

has someone experiences on this and is able to
hint me int othe right direction ?

I assume you have done more than just plugged in a 16 MHz 68000 CPU; I guess
you have changed the system clock (32 MHz), or perhaps you have just altered
some clocks. We need to know before we can give answers.

Are you using a version of the PAK board??

I do remember hearing (long time ago) about people who tried this. They were
able to get the ST to run reliably @ 14 Mhz (cpu clock = 14, mmu = 28), but
not @ 16 MHz. I have done a similar midification, where just the CPU is
clocked @ 16 MHz (but only when the bus is not accessed).

This has worked for the last 5 years.
Clocking the whole ST is probably a better solution, but you need to supply
new clocks for the FDU (needs 8 MHz to read DD floppies) & AICA (for
keyboard).

Are you sure the TOS ROMS are fast enough?

I have a tons of Atari ST items for sale. Please check out my list and
in you are interested email me and we can workout a deal.

list is here: http://www.saber.net/~trekboy/atari.html

Thanks

I have for sale an Atari 1040STE in really good condition boxed with
instructions all disks etc.. a couple of boxed games.
It all works perfectly apart from the internal disk drive which will simply
not play disks it whirs around but wont load them.
Im willing to sell it for �30.00 ono

>
>in your magx.inf file before the #_CTR flag - note the semicolon!

I realize you probably know what needs to be done, but your instructions are somewhat misleading.

First, adding that line does nothing, since any line prefaced by a semicolon is ignored by MagiC.

Second, if you already have a #_TSL line and you simply add your additional line to your MAGX.INF, it will most definitely not have the desired effect, because MagiC will still read the old #_TSL line.

The proper procedure is to either add a semicolon to the front of your current #_TSL line or remove that line altogether. Either way will have the desired effect. That is, to ensure you have no active #_TSL line. The only difference being, if you want to reactivate that line later, the semicolon method makes it more convenient to do so, since all you have to do to reactivate it is to remove the semicolon.

Again, I don't think I'm telling you anything you don't already know. I'm just clarifying your instructions for the person who was asking about it.

I modified one of the Portfolio Serial Adapters into a MIDI adapter by changing the crystal (so that the 31250 baud rate could be produced).

:- so i cant tell: is some chip (eg. the ACIA now
:on 1.6MHz) to slow ?

Very strange. Why would you like to drive the ACIA at 1.6MHz???

The MIDI ACIA won't be MIDI speed, but probably something completely useless.

The keyboard ACIA won't be able to get anything sensible to/from the keyboard?

You do know that several of your chips need to work at their normal speeds and mustn't be enhanced? The both ACIA:s at 500KHz, the soundchip at 2MHz, the floppycontroller at 8MHz...

And what does your picture look like?

:furthermore i had to invert the 16MHz clk to get
:some "results" at all ...

You mean buffer it thru an inverter?
What is your source? Shifter p39 or separate quartz crystal?

I suggest you try to slow down the speed of your system. 12MHz is good, and even 10MHz is better than 8...

Good luck! MG

G'day, I am trying to network a Falcon 030(TOS 4.04, 14 Meg, 850IDE, 1080SCSI), and a 1040STFM (1Meg, Megafile 30). I have tried mikenet and duet with no luck . Duets documentation is in German and Ruftrade dosent do such a wonderful job on it. Mike net,s doc's dont explain it properly. I just need a simple MIDI network for switching the odd file across, any ideas????

You could try MidiCom. MidiCom is a German networking program that allows you to network up to seven Atari computers together to share drives and printers. There is a demo version which is available on most Atari FTP sites, and although the package is in German it is really easy to setup.

Hope this helps.

Regards,

Ben Hills.

no ihavn't altered clks - this wasnt necessary.
i just applied 16MHz to (a 68K 16MHZ) CPU instead
of the old 8MHz CPU.

> Are you using a version of the PAK board??

no, usual 1040ST

> I do remember hearing (long time ago) about people who tried this. They were

> clocked @ 16 MHz (but only when the bus is not accessed).

i now got the idea if perhaps the MMU cannot do a
proper refreshing now.
as the CPU accesses the RAM 50% faster the MMU has
50% less time to refresh the RAM ?!

> >- i have the IMP chip-set in my 1040
>   ^^^^^^^^^^^^^^^ ???

according to the german C't Mag the said, that STs
with GLUE, MMU manufactured by
IMP didn't work with a "normal" MMU 16MHz applied
to the CPU it had to use an
inverter (eg 74F04) before. i just can affirm that
- at least partly (-:

> Are you sure the TOS ROMS are fast enough?

as i've now EPROMs with TOS2.06 i guess so: one is
100ns the other 120ns
according to a 4 clk-cycle read-access 4*62,5ns
would be quite sufficient
for the ROM to be read at 16MHz.

furthermore the ATARI-logo and the memory-test-msg
comes without ANY (pixel)errors
on the screen.

as i put in a disk with a time-set-boot-sektor -
and this was (sometimes) loaded
and also ran properly - i more and more think of a
"blade-running" RAM refresh.
that so i believe just archives it to refresh
stack for subroutines to get the TOS
somewhere, but on heavy RAM access it soon fails -
I'm not at all sure about it,
but it's just a kind of idea that came to my mind.

Martin Graiter wrote:
> Very strange. Why would you like to drive the
> ACIA at 1.6MHz???

you should know that the ACIA gets the 1/10th E
clk from the CPU.
do i apply 16MHz instead of 8MHz to the CPU E is
1.6MHz instead of 800kHz.

anyways the Rx & TxCLK for MIDI & KEY comes from a
separate 500kHz clk
and i got right charakters on the screen by

pressing keys (time-set-boot-sektor-PRG),
but the system crashes always somewhere before the
desktop

> You do know that several of your chips
> need to work at their normal speeds and

ONLY the CPU gets now 16MHz (i took that from the
shifter/MMU)

> And what does your picture look like?

the boot picture is usually fine: the ATARI logo
and bombs ...

> You mean buffer it thru an inverter?
> What is your source? Shifter p39 or separate

korrekt. source is shifter.

> (Do you have any descriptions on files to what
> modifications you've made?)

not really, as i change a lot to get it work.

all 16MHz modifactions presentet in 2 german ST
mags either
accelerated ONLY CPU internal accesses and
switched between 16/8Mhz on RAM&ROM
or switched back to 8 on RAM access (as usual the
ST has a to slow RAM bank)

i was wondering if the MEGA STE has a different
MMU, as the CPU, too, runs at 16MHz

I don't think you can do that & get it to work with such a simple modification; the CPU will be too fast for the rest of the ST.

I think the CPU will get "out of sync" with the rest of the hardware.

Most of the well known CPU modifications involve either swapping the CPU clock from 16 to 8 & back again, or else replace the CPU with a new board that has cache ram & logic to synchronise the CPU board to the rest of the ST.

Perhaps the easiest way for you to make progress would be to try running the whole ST from a faster clock. The 32 MHz master clock is divided down to 16/8/4 for the various subsystems.

If you replace this clock with a 40 or 48 Mhz oscillator, the whole ST speeds up, but the clock ratio's are the same. There are no guarantees that all of the chips will be able to function at this new clock.

A 48 MHz clock will give you a 50% faster ST.
There are a couple of things to watch out for however.

You need to supply 8 MHz to the FDU. It does not have to be synchronsed to the master clock.

You should make sure your memory is able to run at the faster speed.

Your video sync rates will be non standard, i.e @ 48 MHz, th elow & medium rez horizontal refresh rate will be 23.4375 Khz, the vertical refresh rate will be 75 Hz. Perhaps your existing monitors can handle it, but the standard Atari ones will not.

On the plus side, everything will be faster, so there will be less screen flicker.

If you are really lucky, you might be able to get your ST to work with a 64 MHz master clock. This would put the low rez video rates high enough to use a VGA monitor.

Be aware that stressing chips like this can seriously shorten their operational life; having a slow ST is better than no ST.

Check out some old articles in c't , they explained all this in a 'how to' article.

If it's just the odd file, you might prefer to simply use a terminal
program like CoNnect to transfer the file via ZModem.

Otherwise, for networking my machines, I always use MiNTNet, which seems
to be the most flexible solution.

Remember MIDI is very slow, and you might find that in many cases it's
better to use old-fashioned floppy-discs to transfer files.

He Karl,

you're wrong. I've tried both DUET and MIDICOM but I didn't managed to get these things working.
For Duet I think it doesn't like the Hades.
With Midicom I tried the serial drivers which are included in the registrated package but alas I was unsuccesful. I didn't tried the midi driver however. You see the Hades has another type of midi port and I didn't have/and still haven't the right cable.

The port speed is very important indeed. I think one must set on both sides the same speed. For instance 19.200 which is the speed of the modem port of the 1040 STM I believe.

ANNOUNCING THE OFFICIAL WORLD OF ATARI VIDEO!

It's the only one that can sue the name, show you the speakers, get you behind the scenes, and more! That's right, this is the video to own.
If you can't make it to the show, than this will give you the experience(compressed down to two hours - think of it as a Blipvert).
If you are going, than this is the perfect way to remember the show.
Here's what you need to know.

All the speakers will be present on the tape.

Auctions, dealer rooms, and the Atari Archives Museum will be on the tape.

The BattleSphere Tournement will be on the tape.

Extras like direct feeds from the new games and software being displayed at the fair.

AND MUCH, MUCH, MORE!

How does one get tehir hands on this tape? Easily! Just go here http://home.earthlink.net/~santora/woav.htm and fill out the form. It's that easy! After you receive a confirmation, send off your check or money order to the address you will be given tand then that's it. Soon afterwards you will find yourself in posesion of the only World of Atari Video!

ANNOUNCING THE OFFICIAL WORLD OF ATARI VIDEO!

It's the only one that can use the name, show you the speakers, get you behind the scenes, and more! That's right, this is the video to own. If you can't make it to the show, than this will give you the experience(compressed down to two hours - think of it as a Blipvert). If you are going, than this is the perfect way to remember the show. Here's what you need to know.

All the speakers will be present on the tape.

Auctions, dealer rooms, and the Atari Archives Museum will be on the tape.

The BattleSphere Tournament will be on the tape.

Extras like direct feeds from the new games and software being displayed at the fair.

AND MUCH, MUCH, MORE!

How does one get their hands on this tape? Easily! Just go here
http://home.earthlink.net/~santora/woav.htm
and fill out the form. It's that easy! After you receive a confirmation, send off your check or money order to the address you will be given and then that's it. Soon afterwards you will find yourself in possession of the only World of Atari Video!

****Do not reply to above address****
FS; HBS T-36 68000 w/16k CPU cache. Works with MST/ST. If you can find
a PLCC adapter, it will work in an M/STE too. Requires a lot of Atari
hardware experience to install. Would probably fit in a STacy too. A
bit larger than a match book. Impressive speed. Best used with TOS
2.06 or MagiC, ect due to ROM speed. Worked fine with X-Tra RAM delux
card/ICD Link, ect. Very compatible.
Kid is getting braces..need some cash $200.00

How do you connect the interface to the computer? Do you need to solder
it in place?

Keep in mind that you'll either need a patched TOS 1.x or TOS 2.06
if you want to boot from an IDE disk...

Hi All,

I have downloaded a few .WAV files from soundamerica.com and, when I try to
listen to them, AniPlay tells me that many are not Microdoft RIFF-WAV file.
Other players tell me 'unsupported format/file-type' - one actually does
'play' them but the sound is a totally unrecognisable screech !

What type are they ? Can they be converted into a format I can listen to ?

TIA

Jim.

You do realise that there is a commercial IDE adapter being marketed by T.U.S. Developments in the UK, who are reached at

http://www.tusdev.demon.co.uk

This is the IDEal interface which can install a 2.5" IDE drive internally in a normal STE case. The interface costs only 59.95 UK Pounds, which ain't bad!

Cheers!

James

Hi,

I'm sketching on an IDE adapter for the ST/E machines.
It's supposed to be STBook anf Falcon compatible,
which means that you'll be able to use the same
software as in those machines (AHDI and HDDriver)
when connecting harddisks.

Is there any interest in such a product?

I'd only sell them in batches of 10. The price would be around �200 for 10 (�20 per unit), or the equivalent in other currencies. Maybe interesting for computer clubs or resellers?

What would be more interesting: A high density connector for 2.5" harddisks or an ordinary connector for 3.5" harddisks? Maybe both versions will be available?

But you'll have to choose one!

Also, there will be differences between the ST version and the STE version, state which version's interesting for you.

I'd like to know if there is sufficient interest in this for to make a series? I'd need to sell about 50 units (5*10) of the adapter to make break even....

I've previously designed a (postcardware) DD-HD switch for the ST/STE ranges. Very simple, functional and easy to build. The material cost is about �1!
You can check out my DD-HD switch at Marcello Vezzelli's homepage:

http://come.to/vezz.it

He has been kind to include a PCB layout and correct a minor typo for me.

Preferably reply by email, but replies to Usenet are OK too.

When replying by e-mail use this address: graiter@starmail.com
If you hit the reply button you'll have to remove SPAMLESS from the address so that the address becomes as above.

From: mb@tos.pl.net (Mario Becroft)
Subject: Internal connection of upgrades to ST
Date: 1998/08/22
Message-ID: <8SW1CUG@tos.pl.net>#1/1

X-Deja-AN: 383604888
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.st.tech,comp.sys.atari.st

I have been designing some upgrades for the Atari ST, STE and Mega ST(E) machines, but it seems difficult to find a universal way of connecting the upgrades inside the machine.

In general the CPU has all the signals necessary for the upgrade, so the obvious method is to connect the board to the CPU. However the CPU is different in various machines, and in the case of the Mega STE, a few signals must connect to other places.

The Mega ST is good, since it's easy to connect to the megabus. In the STE, it's possible to get some pins to squeese in between the edge of the PLCC socket and the socket pins, however I'm not sure whether this will work in all PLCC sockets, or whether it will bend the pins too far so that they don't contact well if the upgrade is removed.

The ST is the worst, since there is no way of plugging the board in. It would be difficult to solder the board onto the CPU, because the board would cover over the top of the CPU, making it difficult to get at the pins. All I can think of is either: remove the CPU, then solder the upgrade in place of the CPU, and plug the CPU into the top of the upgrade; or alternatively solder a socket onto the CPU, then plug the upgrade in.

Even so, in some STs the CPU is near the front of the machine under the keyboard, where there is no room above the CPU for an upgrade board to fit in. Even if the shielding was cut, the board would still have to be quite thin in order to fit without hitting the keyboard.

And even if I was able to avoid all those difficulties and find a reliable method of fitting, I would still have to make several different versions of the board: one for the Mega ST's megabus, one for the STFM's DIP CPU, one for the STE PLCC CPU, and finally one for the Mega STE, with a couple of signals going to other places instead of the CPU.

And what's more, things get even worse if we are to consider fitting multiple upgrades to one machine. Generally an upgrade that would fit over the CPU would leave no provision for attaching another board in the same way.

The best idea I have thought of so far is this: I will make upgrade boards that connect to the megabus. Mega ST owners can simply plug the board in. Owners of other machines will have to obtain a simple adaptor board that fits over the CPU, or what ever method suits that machine, and gives the machine a megabus. And since each board would have a megabus "through connector" on it, it would be easy to plug in several upgrade boards if the user wanted to. This also means that, although a different adaptor would be required for each machine, only one design of each upgrade would be requied. So it would be enough to get a stock of different megabus adaptors, and it would not be necessary to make four different versions of every kind of upgrade board. However this method would result in added complexity and cost.

I wonder if anyone else has some ideas about how to avoid these problems, without adding too much cost and complexity, and if possible, making it easy for someone inexperienced in the field to fit the board.

Any thoughts about that?

```

the only let down on that one is that to boot from hard drive you need
tos 2.06

Yes, and there already is one: The Upgrade Shop's IDEal IDE HD adapter. It's
STE only though, and fully AHDI compatible. TOS 2.06 is required if you want

```
it to autoboot, otherwise you have to boot AHDI on a floppy.

Yes, but it would probably be the same with any adapter. Only TOS 2.06
recognizes IDE drives on bootup.

Mario,

I seem to remember seeing a megabus adaptor for STs a while back so that video cards could be used. Maybe someone has some details.

>
> The Mega ST is good, since it's easy to connect to the megabus. In the STE, it's possible to get some pins to squeese in between the edge of the PLCC socket and the socket pins, however I'm not sure whether this will work in all PLCC sockets, or whether it will bend the pins too far so that they don't contact well if the upgrade is removed.
>
> The ST is the worst, since there is no way of plugging the board in. It would be difficult to solder the board onto the CPU, because the board would cover over the top of the CPU, making it difficult to get at the pins. All I can think of is either: remove the CPU, then solder the upgrade in place of the CPU, and plug the CPU into the top of the upgrade; or alternatively solder a socket onto the CPU, then plug the upgrade in.
>
> Even so, in some STs the CPU is near the front of the machine under the keyboard, where there is no room above the CPU for an upgrade board to fit in. Even if the shielding was cut, the board would still have to be quite thin in order to fit without hitting the keyboard.

Care to share some details with us?

As far as fitting the upgrades into an STFM I can only suggest an adaptor board that would replace the original processor with a piggyback IC socket on top and header pins to connect to the upgrade by ribbon cable. Messy but perhaps the only solution.

Mario Becroft skrev i meddelandet <8SW1CUG@tos.pl.net>...

:I have been designing some upgrades for the Atari ST, STE and Mega
ST(E)
:machines, but it seems difficult to find a universal way of connecting
the
:upgrades inside the machine.

The blitter has the complete address and data bus drawn to one compact
area. Most ST:s and all STE:s have either holes for a blitter socket or
a
socket and blitter chip built in.

If you make a design that would go into the holes for the blitter socket
you'd
cover maybe 90% of all AtariST/STE:s. And you could just incorporate a
new
place on your board for that blitter chip.

This solution would of course mean that you'd ruin the original socket
(if present) and provide a new one on your PC board.

Anyhow, the area around the blitter is usually roomy, and if you elevate
your
design somewhat, you'd go free from the diodes and resistors on the
motherboard.

Things to attach could be a MC68882 FPU, graphic expansion, a DSP
subsystem
or whatever you like. Or an IDE interface...

With this solution you'd exclude the oldest 520 and 1040 models and also those
motherboards that expect a surface mount of the blitter (or its socket).

But maybe you should consider the ACSI port instead? It is present on all
machines exept the Falcon and it is fast enough for most applications.
But you'd have to have at least one cleaver programmer to write the device
drivers for you...

I did a halfhearted try once to read the contents of an old EPROM through
some clever wiring and programming, but it failed and I haven't tried it
again... :^(

The same goes for the cartridge port which is even present on the Falcon,
and probably even faster than the ACSI. However, every write operation would
take twice the time of a read operation.

Actually I was planning to attach my IDE interface to this port at first, but I don't
know of any driver that supports that? There was an old CD player design
where you could do this, but they didn't sell harddisks.

Maybe I could talk those dependable Germans in to writing their drivers to
support an IDE harddisk on the cartridge port? Achtung anyone?

Why is that a letdown? The 2.06 is the best TOS you can have in an
ST/STE! Also see my reply to Julian Reschke!

: How do you connect the interface to the computer? Do you need to
solder
:it in place?

I'm afraid that there is no avoiding this...
My thought is to use the holes for the blitter socket as a
connection point. If a separate blitter chip is present it
would have to be taken out and reseated into a new
socket which would have to be included in the package.

An inviting thought is to directly try to make some kind
of multiboard with several options on it. Maybe my
DD-HD switch could be thrown in as well? Or at least
drilled holes for it to be fitted by those who wish?
Or a TOS 2.06 decoder for the ST range?

Or even sockets for double 68060 processors with
super thunder DSP-godzilla razorback accellerators?
;^)

:Keep in mind that you'll either need a patched TOS 1.x or TOS 2.06
:if you want to boot from an IDE disk...

I knew that, but this should be no problem. The TOS2.06 decoding could be included on the same design. (I have already designed one, or hmm maybe 5 different designs, but one is better than the rest.)

Believe that there is an old routine in the SCSI Tools package that allowed you to boot from A:\, load the harddisk driver and then continue the boot on C:\ Remember that I tried out something like that a couple of years ago. Weren't you Julian involved in that program development? (I was impressed)

Here's a few sites I came across when I was trying to find some info on my problem in using my Hitachi monitor with my K6. However, I'm gonna try seeing what I find when I use it with the Falcon. However, though some of this is for an IBM clone system, it can somehow be used with the Falcon. I have the Falcon specs in front of me, but unless I'm missing something, I can't find the frequency that it runs for the video.

Using a fixed-frequency monitor on a PC

That's another, true... Some can, some can't. I came across a couple rather large monitors while I was out in Rochester, NY, at this TV repair place, that sold for rather cheap, the GDM monitors, I believe. Now this is something to include in the FAQ once we figure things out.

I went there and it said to download "Microsoft Internet Explorer" or some such nonsense.I'm pretty sure that I need a IBM for that.Of course if I had a IBM PC/AT,I'd use Netscape (with Linux) which supports JAVAScript.

I could already backup my partitions with Gemar 3.06 on a
EXABYTE 8700 using the EXABYTE 8200 *.par.

Today I tried to append another backup at "the end of the tape".
I installed this SPACE plugin.
The whole thing started of as the last time, but after backing up
some files there was suddenly an Error Message.
Something like "Timeout (-8)" and an MSense $FE (0,0) in the top right
(from the controller I guess).

I installed this REQSENSE plugin and restartet.
Again "Timeout (-8)" and then the error message

"... Check condition (DEVICE RESET, ...)"

Why "device reset"?

It was not possible to end Gemar, this dialog appeared again and again- I
had to reboot.

I started GEMAR again and tried to load the indices.
I had to realize that even the old backup was gone.

What was wrong?

My config:
ATARI Mega2->ICD AdSCSI ST-> Seagate ST1480N HD-> Exabyte 8700 + active terminator

Do I need special drivers for the EXA 8700 (meaning that the
8200 driver is not correct)?
If yes: where can I get them?

Any other hints or pointers to backup software?

Thank in advance
ME
P.S.: Please also Cc answers

I've read the Quick FAQs and other source that I can find but I can't figure out if there is an absolute minimum requirements to connect through PPP (or SLIP) to an ISP.

Do you have to have a hard drive?
A minimum amount of RAM?
What if all you want is text-based, does that change anything (soft or hardware)?

Kevin

If you follow the Hitachi link I posted, you'll see that there could be some monitors out there that have a sync switch like the Hitachi I have. What exactly IS the MHz value the Falcon uses?

>Another thing is that the DEC-monitor hardly copes with standard

I suspect BlowUp! will do this, though I've not played with it yet. Prolly time for me to start playing with all this inside and out. I've heard about some going to around 74-75Hz.

>Perhaps you could give the monitor to someone with a graphics-card
>that can handle it? (e.g. myself ;-)

Read the FAQs first, otherwise you're gonna destroy your video card, or worse, the monitor.

You could try this place - it has a database with over 2000 monitors.

I know that the Videl will work at ~75Mhz, so rather high resolutions/frequencies are possible. But this will stress the Falcon-bus, with DMA-problems and poor performance as a result.

I think the Quick FAQ gave an idea on the minimum. I'll check later on...

Forget SLIP. Nobody offers that anymore.

The strict specified minimum for running most components of the usual net setup is: "no HD and 1Mb". But running a program and using it efficiently are two different things. This sort of setup would be so unpractical that it wouldn't be worth it. Think about it:

- What use are email and newsgroups if you can only have say 100K to store the messages you receive. Newsie alone takes up 500K on a floppy, plus STinG, Xcontrol.

- Once you are connected, you then need to launch your browser or mail/news client from floppy. This takes a minute or so, just to fire everything up. Sometimes your ISP will send you a timeout in that time.

- On the web, it will be no graphics, of course, but also no GDOS or fancy fonts, and with no cache it will be really slow.

My advice would be to get a small HD (an old megafile will do fine) and at least 2Mb of RAM. A Mono screen is also much better than a TV or a colour screen.

So a minimum depends on what you will put up with.

On the other hand, if you can get a terminal account and run the text mode applications on a big Unix machine, all you need is a small terminal program running on your ST. In that case you can get away with a 360K floppied 520ST.

Cheers,
Nick

Jargon, terminology and acronyms are the staple diet of any professional, technologist and hobbyist. The world of computing is no exception and to the uninitiated home or small business user, magazines, manuals and books can be very daunting. Written by someone who understands these frustrations and needs, "The Atari A to Z" isn't just a convenient encyclopaedia of modern computer terminology but a specific reference source of material pertaining to Atari computers for the ST, TT and Falcon enthusiast.

Whether you play games on an ST, run your business on a TT, or write music on a Falcon, this book is aimed at helping you get to grips with those magazine articles that are more perplexing than enlightening. In here, you will find many explanations, mini-articles and a plethora of other miscellaneous bits and pieces to help you gain a better understanding of your Atari computer. The material in this book was written with all Atari users in mind. There are simple definitions for the uninitiated and technical data for the experienced. You take what you want, when you want it. "The Atari A to Z" is a valuable addition to any Atari user's library.

These book files are direct ASCII conversions of the Protext files used for the fifth printing. Some typographical changes have been made to keep within the bounds of the Atari character set. Tabs were replaced with spaces. A carriage return and line feed terminates each line.

There have been some minor textual changes and some updates and revisions, especially in the Appendices. There are 2,239 entries, 101 tables and 128,000 words here.

"The Atari A to Z" book text files package is shareware and costs a minimum of 5 UK Pounds. Details are in the accompanying files.

These files and all my other software including PROFILE 2 - *THE* System Analyser are available on my web site:

Check the thread "Falcon to VAX RGB Monitor," as it will have some info
that you may be looking for.

What was this monitor previously used on?

The IBM is not an RGB monitor, it's B/W VGA.

>What was this monitor previously used on?

IBM PS/2 ... and perhaps some clone also.

Well I've got a Nemesis/Videlity set-up though I don't use VIdelity much, even
at 640x480 my 17" monitor is really nice to look at. I've emailed the DEC
support people, as an alternative plan I'm thinking of trying to run the VAX as
a useable computer, but I'm having problems getting DEC Windows to start.....

>Falcon-bus, with DMA-problems and poor performance as a result

Yeah, I've had it running 1280 x 1024 and the machine was running dog slow and
crashing lots....looked impressive though, the whole desktop ion the top

left-hand corner of the screen, wasn't readable though :-(((

I know. Did you ever bother to read the thread I mentioned? It will give you info on how to use that monitor with the Falcon.

>IBM PS/2 ... and perhaps some clone also.

Is it a fixed-frequency? There's usually a way to get them to work with other systems other than what they were used with.

I've got a file that tells about how to get them to work with IBM systems, though you'd do better using the various programs that come with the Falcon that change the output frequency and so on.

Not sure about Minix, but on the Atari computers

Linux usually requires at least an 030 and an FPU. There is a 68K
version floating around, but it doesn't seem to be very official or
stable.

MiNT is usually considered the best unix-like OS, as it was designed from scratch for the Atari, and allows you to run TOS programs (with a replacement AES) while being very similar to unix. The latest version is 1.15 beta.

You can get the KGMD/KEMD distribution kit from ftp.funet.fi.

Cheers,
Nick

Excellent condition Falcon for sale/trade. Comes with the 1435 monitor and homemade video cable. 4 megs RAM and 100 meg internal HD. Original sowftware too. Beetle mouse included (best aftermarket mouse).

Someone made a mod to the unit as there is a small hole cut into the casing of the falcon directly to the left of the floppy. I don't know what was done. Otherwise unit is mint, plastic cover still protecting "Falcon030" logo.

Everything fully tested and works great!

I sold my other falcon for $500 on ebay (that was w/o monitor, too) so make any cash offers in that range, otherwise let's talk trade ;)

I collect everything classic games related... yes, EVERYTHING!!! (especially handhelds).

Thanks,
Roagie

For Minix, it is possible (i did it somes time ago) but wihout HD....It seems
difficult ! I suggest you
to have a small HD at least.

4 Mo is great (my ST have only 1 Mo).

Well, I don't want to argue with Roger, but I'm in possesion of one for SM124.

That little booklet consists of:
1. Specifications
2. Adjustments & maintenace (this far is the first page)
3. Theory of operation
   - Video amplifier
   - Vertical deflection
   - Horizontal deflection
   - Power supply
   - Circuit diagrams
4. Timing charts for HSYNC, VSYNC, etc.
5. Transistor & IC basings
6. Voltage charts
7. PCB layout, Power Supply PCB layout
8. Troubleshooting charts for power, video and sound
9. Video circuit scheme and oscilogramms.
10. Same for Vertical deflection circuits.
11. Same for Horiz. deflection cirscuits.
12. Replacement parts list.

This booklet is published by ATARI, P/N 483-303A. The year is unknown for me, because my booklet is only a lousy photocopy, but readable enough.

Bye, tom.

No, it is/was a UNIX-like *operating* system. Someone(*) ported the
filesystem which was part of that operating system to MiNT way back when,
so the Minix FS is the de facto standard filesystem for MiNT nowadays.

Minix used to be "sold" by Prentice Hall in that it came free with Andy
Tanenbaum's book "Modern Operating Systems", as a kind of worked example.

(*) What was his name again? Henson?

You can do a lot by controlling the Falcon's Videl chip.

Never mind. I just used: (select A drive) File | Format. If I recall, old ST's like mine would boot up faster if a disk was in the drive because there was some extra info on the boot sector which would load into ram faster.

I guess even if a disk isn't bootable after st2dos, I can still boot the machine without a disk inserted.

>
> I don't need to be able to boot TOS with these disks (I boot with a disk
> holding an app) but after I convert them with st2dos, will I still be able to
> read them with my old ST? (it had the external single-sided floppy drive)
> Thanks.
>

Well, here's what happened: I formatted a disk, copied some files over from the older disks, and inserted it into my PC and ran st2dos. I could now copy the files over onto my PC. I then copied a text file from the PC and yes, I could read it with an editor on the ST.

So what's going on here?   st2dos just "updates" the boot sector on the disks that were formatted on the ST?   They should now be readable to dos as well as early tos?

If I format a disk at 720k on dos, then use st2dos, should it be readable from the st? (I'll try it tonite--but *should* it?)

The reason I'm asking, is that I'm now running into trouble trying to format disks on my st (single-sided) drive. In the past I've been able to format and use 1D, 2D, and even HD disks with the hole taped over. I was able to format a few last night, but I'm occasionally running into errors (on seemingly perfectly good disks which format no problem in dos). Sometimes it stops midway with the message "An error has occured during format or copy, target disk may be unusable" or it nearly completes with a message like "check the disk or drive connections".   Everything is in order--is the drive starting to go bad?

Could this be a dirty head? I have a cleaning diskette, but it says "do not use on single sided drives" Why not? Is the arm on a single sided drive in a different position? Thanks.

You can't.

Unless it's an ooold PC Bus mouse, then you can.

If it's a PC serial mouse on the ST serial port with the appropriate
driver, but that means no modem and no autobooting games.

You can buy a PC serial mouse adapter from Mario Becroft in New Zealand.

You can also adapt an Amiga mouse, or just buy an Atari mouse from any of the remaining Atari dealers.

Details in the Quick FAQ (where else!)

Cheers,
Nick

Just to clarify a few points: Old TOS format is almost identical to IBC-PC format except the bootsector. An ST can read any PC disc, and alwasy has been (as long as the drive can cope, ie. single sided, HD etc). The only problem comes when a PC tries to read an old TOS disc.

This means that any special bootsectors (some games) cannot be read. If they are converted using st2dos, they will no longer be able to boot. However, depending on the game, the boot sector can be restored using the Ultimate Virus Killer which has a large database of boot sectors.

Newer versions of TOS - from 2 (and Magic) format discs with a PC bootsector to aid in transfering data.

A 720k disc is a double sided, double density, so it cannot be read by a single sided ST disc.

I've just checked the DOS help on format and it cannot format a single sided 3.5" disc, so you will have to format it in TOS.

Alternatively, buy a double sided drive - it is easy to change and only costs a few quid.

One point about using high density discs: this certianly used to be the case a few years ago, but HD discs have a more dense material and require a stronger magnetic field to succesfully write to them (which HD drives can produce). This means that using a DD drive with a weaker field strength runs the risk of data loss on the higher density material. As I say, this was the case a few (6 or 7) years ago, and modern HD discs can maybe cope with a lower field - just beware!!!

As for the trouble in formatting a disc, maybe the head is out of alignment. There is probably some sort of performance utility you can get - don't know personnaly.

Can't think why you can't use a cleaner on a single sided disc though.

Hope this all helps,

Gav.

What I meant to say was that while the "converted" ST disk was in the PC, I was able to copy a text file to it, remove the disk and place it in the ST, and then open that file with a text editor. Both a PC and an old (pre 1.04) ST *should* be able to read/write from a disk that has been "converted" with st2dos , right?

Did some more reading. HD disks (with the holes taped) in an ST are Not Good. Apparently, when the tracks of these disks are formatted at 1.44, a higher magnetic current is used which is hard to overcome with the ST drive head. I'll stick with 2DD's. (funny thing--some HD's formatted in the ST)

I also read that there is a faq for st-pc/pc-st conversions, but couldn't find a url for it. Anyone have it?

Hi

I have been having quite some problems with my falcon lately and im wondering if anybody knows what the problem might be.
After a bit of use, the falcon crashes with flickering lines on the screen

(mostly on the right , vertical lines). When i turn the system on and off,
it usually doenst even display the atari logo anymore, it just hangs. If i
wait a bit longer (about 10 minutes) , it comes with (even in ST high
resolution boot) flickering lines in the atari logo and hangs shortly after.
If i wait longer or cool the system (half an hour), it works again for a
while.
Somtimes it displays lines, but then doesnt hang, but keeps on working
really slow.
I already swapped PSU, FPU, and memory boards, but the problems stay.
The system is a standard TOS 4.01 system without any modifications.

If anybody has any idea what it could be..
Some thermal problem.. but what ?
Clock? ComBel ? 030?

Hi

I had a mouse a while back that had a switch, the switch settings were for
the Amiga and for the ST/PC; a 2 position switch only.

I never had the chance to try it on a PC, whether this is of any help to
you.

Actually, a 2s2d disk can be formatted in the SF354, but it will only be usable as a single sided disk (that's what I've done many times)

>

Apparently (by what else I've read on dejanews) it may have more to do with the rpm's varying. I found a utilty at the umich site (under diskutils) called speedst.lzh (speedst.prg) which checks disk speed and another called tracker.lzh (tracker.prg) which checks disk tracks. Are these the right tools for this situation? Or what?

> Can't think why you can't use a cleaner on a single sided disc though.
>

I'm just worried that the head touches the disk in a different way such that it will hit the plastic part of the cleaning disk. Anyone out there use one?
Thanks.

I didn't have your specific problems, but I had other problems with my Falcon. Everything from screen glitches (different from yours, though), to internal IDE problems, floppy problems, sound problems, random crashes, just about everything.

Turned out to be a bad power supply. I bought a new one from Best Electronics and my Falcon (and previous Falcons) never ran better. Even the screen display is better. It also runs cooler than my previous Falcons.

I guess Best's power supply is of a better quality than what I'd had before. It's an Atari P/S, but just looking at it, you can tell that the workmanship is much better. And some of the 'thingies' on it are bigger, which may mean a bigger capacity or something, I don't know.

I never realised that format could be done on a PC, there is a formatter on the ST to do the same thing (ST Format cover discs were formatted using it, to allow single sided users access to at least some software)

They sound like the very chappy's you need!

The head scans in the same manner as a double sided disc. Although,
maybe the head presses harder onto the disc surface, hence, using the
abrasive material would damage the head.

As you mentioned you can use any disk in your drive, you can be sure
that they are mechanically all the same.
The problem can only be the opposite side of the head, which is no nice
smooth metal head but a sort of rough pad like in tape recorders
designed to glide on a smooth surface. This could perhaps be damaged by
the material of the cleaning disk.

I have an old NEC mutlisync monitor that is starting to do some
strange things! I'll boot my Falcon and start using a program, and all
of a sudden the montor will almost go blank except for some squiggly
lines on it, and it starts to make a sound like rapidly sequenced pops
and crackles. zz-pop-zz-pop-zzz-pop-zz-pop!!
Sometime if I turn off the monitor, and then turn it back on it
returns to 'normal' for a while. Most of the time though I have to
reboot the Falcon to get back to normal, until it happens 5 or 10
minutes later!
Obviously a component inside is going, but does anyone here have a
clue as to what might be wrong?
resolution and colours don't seem to matter.
thanks.merci

Are there any programmes out there to transfer data from palmtop
PCs/Organizers to the ST. I am considering buying one, although I have
access to a PC and can run ACSII files via disks, I would perfere to
do it directly.

Thanks,

James

Yup, this is certainly possible with a Psion.
Take a look at Tim his page :

That's exactly what it was! I decided to open up the drive to clean the heads manually, and indeed the opposite side is a felt pad. The cloth cleaning disk might have wrecked it. (For anyone who cares, it's the bottom side of a single sided disk that gets written to)

After cleaning it seems to read disks more reliably, but I'm still having some trouble writing to and formatting disks.

I noticed that this drive has a rubber belt--have these been known to go bad?

Well, I'm tired and got home just a bit ago but I wanted to say few things.

The show was great. Kudos should be put out to everyone involved especially Richard Tsukiji,Keita Iida, Don Thomas, and John Hardie. They all put on a most excellent show. Of which I was more than pleased to shoot over eight hours of video to whittle down to a two hour video. The speakers were engaging, the exhibits were interesting, and the atmosphere was light. Everyone involved seemed to have a good time.

As for an indepth report, you can read it tommorrow at NGO.

As for the Video, I will update my page with some stills from the video once I've logged the tapes and gotten some sleep. But here's what I can tell you to wet your appetites.

Finally NOS.046 is ready ! I am going to put it on:

ftp.interware.it/users/mike/pub
or go to:
www.interware.it/users/mike
and look for the "public download directory" at the beginning of the page.

You can also request the file at my BBS, +39-40-768412 fidonet+nest
2:333/608@fidonet.org
90:700/104@nest.ftn

I can also send you the files by email, tell me what version you need.

nos046.lzh   is the 68000 binary+readme
nos04630.lzh is the 68030 binary+readme
nos046_s.lzh is the sources archive

- I added the ability for nntpcli to try GROUP and STAT commands after a failure occurs with the NEWNEWS command, provided that NN_USESTAT was #define'd at compile time. It seems that NEWNEWS is disabled by some Internet Service Providers (ISPs), who think it adds overhead to their NNTP server, and who reason that NEWNEWS is not needed by a news client. Nos can now use typical news client commands to recover from a newnews error, BUT the news groups must be explicitly named, that is, the names must not contain a '*' or '!'. The article numbers for each host and newsgroup are stored in a new file, named "<area>.rc", kept in the same directory as the associated . I modified nntp_job() in nntpcli.c and added statnew().

- I finally included the pop3 mail client, it works as in standard nos doc, try "help popmail" to know more or read here, note that 'pop' command and 'pop2' protocol are not implemented in Atari NOS (do you need them?):

popmail

[N.B. This is different from the 'pop' command].

The Post Office Protocols (POP2 and POP3), are mail protocols designed for use in networks containing hosts that are normally turned off when they are not in use. In this environment it is not possible for an SMTP mail server to deliver mail to these hosts because they are not always available.

The solution to this problem is to designate a mailbox server that is available to the network at all times and can accept SMTP mail for other hosts. When a host comes on-line it uses POP to access the mail in its mailbox(es) on the mailbox server.

The advantage of using a POP server at an area mail gateway is that when mail arrives at the gateway for a station that may not be available, the gateway does not have to waste time trying to establish a connection with that station. Instead it accepts the mail and places it in the addressee's mailbox, just as if the addressee were a normal user on the gateway system (that is, this is the same thing that is done with AX.25 BBSs).

As POP2 and POP3 are different and incompatible protocols, both the POP2 and POP3 servers should be started, to handle all POP requests from clients.

The POP server requires one data file called /popusers.

The POP protocols are very simple, with minimal error handling. When an error is encountered, an error message is generated and then the connection is terminated. You then have to re-establish a connection to continue.

```
-----------------------------------------------------------------
popmail addserver <host> [<seconds>] [<hh:mm-hh:mm>] <protocol>
                                  <mailbox> <username> <password>
-----------------------------------------------------------------
```

Add <host> as a pop server. When <seconds> is given, a timer is started to query the host with that interval for mail.

If not specified no quering to the pop host will be started. You have to do that manually with a 'kick'.

When <hh:mm-hh:mm> is given then only in that exact timeframe are queries to the host made (allowed).

Protocol is either POP2 or POP3, depending on the mail service the host is providing. Note: pop2 is superceded by pop3.

<mailbox> is the mailbox name on the host from which mail has to be picked up.

<username> and <password> are this system's validation parameters for the host (in /popusers).

Note that on entering this command the host name is looked up. If non existent an error message is presented.

>> Example: (all on one line):

```
   popmail addserver ns9bob 1800 00:00-03:00 pop3 ns9liz ns9liz
                                                       lizpasswd
```

```
-----------------------------------------------------------------
popmail dropserver <host>
-----------------------------------------------------------------
```

Drop host from the list of pop servers to be queried. All references to the entry are deleted from the current system.

```
>> Example:  popmail dropserver ns9bob
```

popmail kick

Kick the local POP client, to get mail from the server. This command is needed when no interval is specified with the 'popmail addserver' command.

popmail list

List the current popmail server table.

popmail quiet [on|off]

Default: off

Display or set the POP quiet flag.

This flag determines whether the bell sounds when the system announces that incoming mail has arrived. When quiet is set to 'off' you hear the bell.

```
>> Example:  pop quiet on
```

popmail trace [<level>]

Display or set the trace level of POP sessions.

```
<level> = 0:  no trace
          1:  serious errors reported
          2:  transient errors reported
          3:  session progress reported
```

All trace output goes to the session log file.

```
* -------------------------------------------------------------------
* # Example of setup for the POP3 mail client
* popmail addserver 151.99.226.3 POP3 mike mike mikepw
* #popmail quiet on
* fkey 62 "pop kick 151.99.226.3\n"
* -------------------------------------------------------------------
```

- Enhanced Help function. Now you can use '?' as before to list available commands and help <command> <subcommand> as long as you put *.HLP files in the help directory, same sintax as ftp.hlp, I am giving some starting help files with 0.46, how do want to complete the job ?

- I also modified few things like the fkey command, to catch the correct keys from the Atari keyboard, please check how it works.

- Please send me your impressions and requests, maybe I will be able to go on with the project if enough people is interested.

I mentioned it because most people will want to auto boot. You are
probably aware that there already lots of extensions like this?

> Believe that there is an old routine in the SCSI Tools package that

Yes, that's part of SCSI-Tool. It's called AUTO-C.

any atari mods are more than welcome and i hope you get the customers

to someone who does'nt allready have it it adds too much to the price
of the interface,and unless they really need an all in one unit
{i'm assuming yours goes inside} they are likley to go for scsi
and be able to chain several devices if needed,these interfaces
would have been brilliant about three years ago but now there
isn't a huge difference in the price of a scsi or ide drive

i have the TUS IDEAL interface and switchable tos's but there are still
a few programs i use that will not run on 2.06
don't advise me to change programs as this would cost me more than
a new computer!! :-))))) a patch would be great

Dave Escot of the upgrade shop was to write one but it seems so far
to have fallen by the wayside due to the workload his VELOCE board
has spawned

I have to add to Mark's comments:

The show was great. The vendors had some excellent stuff for sale. The Jaguar System Test board I bought is great. Now I just need to figure out how to use it.

There were a lot of past Atari employee's (engineers and programmers, not marketing bozo's). Jerry Jessop, Dan Kramer (5200 trackball designer), Dave Stagus (my spelling is bad; programmer for Exidy's Venture arcade, Jaguar ROM programmer, 2600 programmer), Rob Fulop (2600 Night Driver & Missile Command, Night Trap and Sewer Shark programmer), and many more. They were all great individuals to speak with. They were happy to speak with fans and were right there the whole time enjoying the show with everyone else.

Curt Vendel had an excellent display of some very rare Atari stuff. The self-centering 5200 joystick, a early design of the 1450XLD, a 1400XL with the actual name plate on it (mine is missing that), cartridge prototypes, and much more.

They had a museum that was incredible. One of the neatest things I saw was a piece of hardware that was the actual court evidence used in the law suit against Coleco by Atari. It was a Colecovision 2600 adapter that was hooked up to a board containing basic resistor/inductor/capacitor and other components. This was used as proof that Coleco had copied the 2600 and that the Colecovision was not actually running the 2600 software, it was being used as a television interface. And that was just one of many rare items they had on display.

All kinds of arcade games to play that were set on free play!

Keep an eye out, because there should be another one next year. This is one not to miss!!!!

One question-- did you whittle down the auction footage as well?

The show was great, the speakers excellent, and the museum was wonderful.
However, 90% of the auction was either junk that someone should have known
better than to try to sell, especially at the minumum bid price, or things
that were outrageously overpriced.

It was great to realize that not all of us collectors have lost our minds
and would pay any price just because something has a Fuji symbol on it.

A plastic Atari cartridge organizer for $50? I don't think so!

Mark

I bought the cable which is shown in the ZyXEL manual and
installed STiNG now, the dialer works fine and I can use a
tiny telnet program.

But:
As soon as I use CAB the whole machine stops when loading an URL
and I have to reset it all
(A dialog with "Fehler:
Status: Connecting to host..."
pops up and then CAB never returns).
(I tried CAB 1.4, 19.9.1996; plus correct installed CAB-OVL 1.2904, 18.4.1998,
STiNG Vers. 1.12).

And another problem: if I switch on the ZyXEL and then the Mega 2
the RxD and TxD lights start to flicker as soon as the desktop
appears (as if the modem is receiving or sending something).
After a few secs the ATARI throws 3 or 4 bombs.

I'm not sure whether this is a hardware problem or a problem
of software version mismatch.

Any pointers ?
Which ftp programs do you use?
Which telnet progs do you use? (I'm not 100% satisfied with the one I got)

Please Cc answers to my email address
Thanks in advance
ME

Hey Mark!

I agree with that! It was pretty funny how nothing sold, but I wish there had been a little more heckling at the prices. The lady who bought her 10-year-old son the Atari pin got bit on the ass. Hopefully people won't take that at the going rate and start upping their prices accordingly. Especially after the other pin went to Nowheresville at $25.

This sounds like a software problem with your Mega2.
2 years ago i use the same modem with a falcon, anytime without trouble.
Make sure your modem cable allready have connected RTS/CTS.
Use HSMOdem7 as serial driver on your atari.
Switch on RTS/CTS !

I think this is not a problem of STinG/CAB, maybee driver or cable..

aFTP is good to use with sting.
I doasn't use telnet. irc looks better .)

Regards, Robert

From: mb@tos.pl.net (Mario Becroft)
Subject: Announcing Atari Serial Mouse Interface
Date: 1998/08/25
Message-ID: <60Z1CYE@tos.pl.net>#1/1
X-Deja-AN: 384487691
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.st,comp.sys.atari.st.tech
```

ANNOUNCING THE ATARI SERIAL MOUSE INTERFACE
  ----

* Allows any serial mouse (as used on IBM compatibles) to be connected to
  Atari ST(E), TT, Falcon or compatible computers.

* Support for serial mouse, track-ball, touch-pad or any other Microsoft or
  Mouse Systems compatible serial pointing device.

* Easy installation: just plug in and go.

* Unlike other "solutions", the interface doesn't tie up your serial port,
  or require special software drivers.

* Third button or wheel can act as a double click of the left button, or on software/hardware that supports it, as a real middle button.

The Atari Serial Mouse Interface is the best solution for replacing a worn-out Atari mouse, or ensuring that you will never have trouble obtaining a mouse in the future. Serial mice are used on IBM compatible computers, and are readily available from any computer dealer.

The interface is also handy for those who are tired of the slow and clumsy Atari mouse. With the wide range of serial mice, trackballs and touch-pads available, you will have no trouble finding a pointing device to suit your taste and budget.

Plus, if like many users you find double clicking tedious, simply obtain a serial mouse with middle button or wheel. Then a simple press on the middle button or wheel acts like a double click - no more double clicking hassles. Or if you use UNIX or other software that uses a middle button for other purposes, the interface can be configured for that, too.

Installation is simple. The interface is a small unit measuring only 4x5x1 cm, with a serial mouse plug at one end, and a cable that plugs into your Atari mouse port at the other end. To install the unit, simply plug it in - no other setup is required. And being so small, it sits comfortably on your desk without taking up too much space.

ORDERING:

Units are available directly from me:
* $25 US dollars or 15 UK pounds each
* $30 US dollars or 20 UK pounds each including 3-button serial mouse.

User groups or clubs, contact me for information on quantity discounts. Dealership enquiries welcome.

Postage to most locations in the world for a few units will be $5 US dollars or 4 UK pounds, and delivery will take a week or two. Contact me for an exact figure.

The interface will be available locally in the UK very soon.

Enquiries: Email: mb@tos.pl.net

Post:
Mario Becroft
PO Box 332

It's been years since I opened any of my ataris, but I seem to recall that my STE had the blitter soldered directly on the motherboard. Or is it just my memory that's foggy?
I don't mind soldering it it though.. After all, I got my STE in change for two tapes containing a live consert with Pink Floyd... ;)

Hi there,

I ve got an 1040ste and I 'd like to know if it is possible (and how) to
connect an hard disk to it SCSI IDE ?
Can it simply connect a standard scsi disk that we found today everywhere ?
Thaks for your help

Gil

Are you using a ST, or a Falcon. If an ST, try soundlab, if on a
Falcon try usinf nedplay. That screeching could be that it is a
'signed' format and needs to be switched.

yes but like anything else you need a host adaptor usually built into

a lead,some software to boot it with, ataris own is free
once you have one linked up if you want you can chain more and even a
cd rom

there is also an ide adaptor that fits inside and will even let you
mount a 2.5 ide INSIDE an ste

Check out the Quick FAQ it's all in there.

SCSI will require a SCSI host adapter. IDE will require an internal IDE adapter board.

Cheers,
Nick

Great idea ... keep cost low, of course ... also be sure it can run under single TOS, I dont use Magic becuse its incompatible with Cubase, I'm sure a lot of Atari musicians do the same.

I have a Seagate/Imprimis 330Mb hard drive that is behaving oddly. One of the suggestions I've received is that the drive is developing bad sectors and the problems occur when the system tries to write to one. I'm not aware of any Atari equivalent of Microsoft's Scandisk. Is there such a beast that can remap the drive in a way that HDdriver can recognise?

I'm using a TOS 4.04 Falcon, btw.

Keith

You could try Diamond Edge. Can't remember where I got mine from - it
was years ago, but I'm sure System Solutions could help.

Diamond Edge can repair/map bad sectors on a drive etc.

Gav.

What driver are you using, Keith? Any decent driver will map-out bad
sectors when it gets a failure. The SCSI protocol has hardware support
for this sort of data integrity.

What do you mean by 'oddly'?

>I'm not aware of any Atari equivalent of Microsoft's Scandisk. Is there
>such a beast that can remap the drive in a way that HDdriver can
>recognise?

Why not get hold of HP_OPT v2.7 from :

www.cix.co.uk/~derryck/software.htm

This will do logical checks and will repair obvious problems. It is also a VERY reliable defragger.

For more complete diagnostics you may need Diamond Edge but this is commercial.

Also, Zorg is now freeware. It defrags and does logical checks but is more limited in repair capabilities.

>I'm using a TOS 4.04 Falcon, btw.

Well, it shouldn't be this causing the problem.

Subject: Re: Announcing Atari Serial Mouse Interface
Date: 1998/08/28
Message-ID: <4631CXF@tos.pl.net>#1/1
X-Deja-AN: 385454567
References: <60Z1CYE@tos.pl.net>
Organization: Tariland Computer Club
Followup-To: comp.sys.atari.st,comp.sys.atari.st.tech
Newsgroups: comp.sys.atari.st,comp.sys.atari.st.tech

28/8/1998 ANNOUNCING THE ATARI SERIAL MOUSE INTERFACE ** REVISED **

---

* Allows any serial mouse (as used on IBM compatibles) to be connected to Atari ST(E), TT, Falcon or compatible computers.

* Support for serial mouse, track-ball, touch-pad or any other Microsoft or Mouse Systems compatible serial pointing device.

* Easy installation: just plug in and go.

* Unlike other "solutions", the interface doesn't tie up your serial port, or require special software drivers.

* Third button or wheel can act as a double click of the left button, or on software/hardware that supports it, as a real middle button.

The Atari Serial Mouse Interface is the best solution for replacing a worn-out Atari mouse, or ensuring that you will never have trouble obtaining a mouse in the future. Serial mice are used on IBM compatible computers, and are readily available from any computer dealer.

The interface is also handy for those who are tired of the slow and clumsy Atari mouse. With the wide range of serial mice, trackballs and touch-pads available, you will have no trouble finding a pointing device to suit your taste and budget.

Plus, if like many users you find double clicking tedious, simply obtain a serial mouse with middle button or wheel. Then a simple press on the middle button or wheel acts like a double click - no more double clicking hassles. Or if you use UNIX or other software that uses a middle button for other purposes, the interface can be configured for that, too.

Installation is simple. The interface is a small unit measuring only 4x5x1 cm, with a serial mouse plug at one end, and a cable that plugs into your Atari mouse port at the other end. To install the unit, simply plug it in - no other setup is required. And being so small, it sits comfortably on your desk without taking up too much space.

ORDERING:

Units are available directly from me:
* $50 New Zealand dollars, $25 US dollars or 16 UK pounds each
* $60 New Zealand dollars, $30 US dollars or 20 UK pounds each including 3-button serial mouse.

Controlling price is in New Zealand dollars, prices are subject to change based on fluctuating exchange rates and other factors.

User groups or clubs, contact me for information on quantity discounts. Dealership enquiries welcome.

Postage to most locations in the world for a few units will be $5 US dollars or 4 UK pounds, and delivery will take a week or two. Contact me for an exact figure.

The interface will be available locally in the UK very soon.

Enquiries: Email: mb@tos.pl.net

Post:
Mario Becroft
PO Box 332
Kumeu
Auckland 1250
NEW ZEALAND

If ordering from outside New Zealand, you can pay by a BANK CHEQUE IN NEW ZEALAND DOLLARS (NOT PERSONAL CHEQUE). Alternatively, you can send US or UK currency by post, but it is YOUR RISK if it gets lost in the post.

P.S. Please distribute this announcement to any relevant Atari forums as you see fit.

And watch this space for some more Atari hardware announcements soon.

Well, the show is over. By now you've heard all about it. But wouldn't it have been great to see and hear the speakers? Watch the BattleSphere Tournement? Play or even just SEE a working Computer Space Machine? What about Neutron Star, an Atari Pinball Machine? 5200 Tempest? Or how about hearing how Wiztronics is possibly going to release a stand alone lynx box for your tv(no lcd screen) that uses a Jaguar Joypad?

Worry No More! That's right. You can hear, see, and experience it all(minus tactile and olfactory feedback)! For $25 including shipping in the US, you can have it all. Just follow the link below!

And now for a production update. After a tough early week(my ide controller died on my new motherboard), I've logged 3/4 of the footage shot and will be hammering down this weekend to set up the outline of the tape and start editing. We're well into post production folks. Also, for those that need it, I can now get PAL copies of the tape.

-More soon.

Albert,

I've looked around a bit for the configuration to use and haven't gotten a clear understanding yet. It is "supposed" to be easy if your card is ET4000 based (like mine), but I haven't figured it out.

Please let me know if you find anything, and I'll keep you informed if I do.

Regards,

Dan

You need an DMA to SCSI Hostadaptor like LINK '96 / '97
Works fine with any SCSI disk (Use HDDriver7)

Regards, Robert

Can't help you with your problem, but Fridolin at Aixit understands English quite well, so I suggest you mail him direct on aixit@aixit.com.

Regards
       Peter

With any luck it is just the boot program which is corrupted. To check this:

Load the disk driver from floppy (I assume he still has the issue disc).

From the desktop 'Install' drive C: (and others if he has them defined).

Attempt to 'Open' the partitions.

If this works then all he needs to do is to re- 'Install' the hard disk driver.

If this does not work then either the mechanism is faulty or the partition info. in the boot sector is corrupt. If he can remember how he partitioned the disc he can rectify the second fault by using a program such as Diamond Edge which allows you to 'Write Partition Info Only'.

Check out the Quick FAQ.

Normally, just stick the Atari disks into the PC drive.

If this doesn't work:

Make a disk image file from each disk using makedisk.exe.
Use an Atari emulator like PaCifiST to read the disk image files.

http://www.fatal-design.com/makedisk/
http://www.fatal-design.com/pacifist/

Maybe the disks have gone all screwy after the years. This happens a lot
too.

Cheers,
Nick

Your move from 60Hz to 50Hz, may arise probleme on MINT

did you try on normal TOS.
May be your mint installation does not like the 50 Hz.
try re_installing your MINT...

Fine and dandy.. I'd LOVE to be able to transfer files between my Falcon and my Mac. However, I don't use Mint or Sting.. I assume they are alternate OSs.. I mainly only use my Falcon for music, so running an alt OS makes no sense, as CAF doesn't run under them.

It would be a MUST to write a driver that works with TOS.. at least to me.

MiNT is an alternative OS, but STiNG is a single-TOS TCP/IP stack.

> It would be a MUST to write a driver that works with TOS.. at least to me.

STiNG is just that, but you'll need to set it up for LAN networking:
http://www.stud.uni-hannover.de/~perot/index-e.html

Keep in mind that what you want to do may not work.

However, you will need the adaptor that will allow you to use a VGA
monitor on the Falcon. Now search for a cable that has the 15 pin VGA

cable connector on one end, and 4-5 BNC cables on the other. You may also have to do a little tweaking to get the monitor to work with it. There's mention in the Sun workstation newsgroups that have dealt with this question, but with using the monitors with the IBM clones.

I've got an old Sun diskless workstation, with those huge heavy monitors, and I'll have to try it sometime on my Falcon.

The Falcon doesn't handle sync-on-green (which the DEC-monitor apparently has, since it only has three BNC-connectors), so I don't think this is possible without some additional electronics. I have never tried anything like this, so I'm afraid I can't be of any more help...

Another thing is that the DEC-monitor hardly copes with standard VGA-resolutions, but probably needs a special resolution (e.g. 1280x1024) at a fairly high frequency. The Falcon-design isn't suited for such displays, and you can't see anything on the monitor until Videlity or similar kicks in.

Perhaps you could give the monitor to someone with a graphics-card
that can handle it? (e.g. myself ;-)

I was thinking of doing something similar, only in this case I have no
idea where the monitor comes from, although the brand is Digital, so
chances are it may be similar to yours.

It ought to be fairly straight-forward. Since the monitor only has three
BNC connectors, red, green, and blue, the sync is put on the green signal.
Try searching in metacrawler or similar for "sync on green".

Once you've got that figured out, the other problem is the scan rate. I
heard that these monitors have wierd scan-rates, although recently I heard
that they can sometimes work at standard VGA rates. I guess it's just a
matter of trying it out. I'll post here when I get around to trying mine,
and let you know how it went.

We've just purchased a Quantum Fireball 2.16 GB SCSI hard disc drive for use on a Atari Mega STE, but there seems to be a problem. Firstly the Mega STE SCSI interface doesn't support Parity, but even if we avoid that problem, the drive still doesn't work. I understand that this is caused by SCSI bus arbitration which is used by the drive but not supported by the SCSI interface in the Mega STE.

The shop will exchange the drive for another Quantum model, so can you suggest a Quantum drive of similar size which is suitable for use in the Mega STE.

Also I would be interested in a more detailed explanation of what the bus arbitration is about (also I've heard of initiator identification). Just what is that about, and how does it relate to the Mega STE's SCSI interface?

Any assistance would be appreciated.

Someone had asked a while back about using an SLM on the Falcon. I just got the March 98 issue of ST Computer and there is a company advertising it. I have heard that it was never developed, didn't work, ect, but here is the info, for what it is worth.

As far as I know, bus arbitration is to allow the hard drive (or other SCSI device) to be accessed by more than one controller. For example, two computers sharing one HD, each computer has a different controller address and the HD only allows one access at a time.

So, you could have a PC and an Atari sharing a hard drive, each with different partitions, including shared partitions. (I know with Apdaptec controllers you can change the SCSI address to be something other than 7.)

This is my understanding.

Parity on the drive *should* be selectable by a jumper. One thought is, the drive my be waiting for a start command?

Carl.

So, how can I tell if my Mega STe has this problem and where can I get the corrected GAL?

As I understand it, the problem arises because the data transfers and
drive access are attempted at the same time, causing lost data. It only
causes problems for me with binary transfers over ~80K. For web
browsing and sending and receiving email and newsgroups - no problems.

If you want a cheap and easy way to access binary files via the web,
use a RAM disk for file transfers. In CAB, this means setting the
cache to a RAM disk.

>SCSI interface in the Mega STE.

I don't believe you can connect a drive with bus arbitration to the Mega, since you can't give the controller a SCSI-address, like you can on the Falcon and TT. I seem to remember seeing somewhere that the Link-97 would support those drives too, but I'm not quite sure about that.

>The shop will exchange the drive for another Quantum model, so can you
>suggest a Quantum drive of similar size which is suitable for use in the
>Mega STE.

I believe that the Atlas works, though I'm not sure about that either since I haven't tested it. Since the Atlas works perfectly in every aspect with CAF on the Falcon, while the Fireball and Empire (which both use arbitration) don't, I suspect that the Atlas works with a normal Link-interface with the Mega too...

I need help. I have a 520 ST, with the updated 1040ST rev 2 board and only 512k. I added the new Drams in the free slot and I also added the proper resistors. However, things are not working all that well. Things are crashing upon bootup, etc. I am very frustrated because all of the info I can find is in German, or for upgrading to 4megs, etc. Any help would be gladly appreciated. Thanks.

I have an older Ataril Laser printer, I think it is the Atari Laser SLM804 or is it the 604 Not sure.

Well anyways I'm looking to hook it up to a newer mac and was wondering if anyone had any clue how I could do that?

Help would be great.

Thank you

There are shareware drivers and one commercial that meets the standards today.

The best choice is the commercial HD Driver (currently v7.55?). Runs great. Only problems I've had with HD Driver (I use 7.51 I beleive) is that I can't get the BigDOS (IBM-PC partitions over 33Mb) support to work 100% in single TOS, and I can't use the parking util in MagiC.

If intrested, go to Uwe Seimet's (the developer's) page:
http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

If you are more intrested in shareware, go to Rainer Seitel's (the author of BigDOS) homepage: http://home.pages.de/~Rainer_Seitel/bigdos.html, where you also can download the shareware CBHD driver.

I'm afraid the answer is no.
The ST parallel port lacks some bi-directional signals used by all parallel devices.
Look for a SCSI one.

I have been trying to attach a 12 GB Quantum Bigfoot TX IDE hard disc drive to an Atari IDE interface, but the drive doesn't seem to work properly. I never had a problem with smaller drives, but with the 12 GB model, the following problems occur:

Using AHDI, the drive is not recognised at all.

Using HDDRIVER version 6, when I try to parition the drive using HDDRUTIL, it shows up with a capacity of only 4 GB. However it does allow me to create up to 8 GB of partitions (but not the full 12 GB). The drive then works fine, although with the reduced capacity.

What is happening there? Any suggestions would be appreciated.

I believe it is well known that many floppy disc drives are unsuitable for use with the Atari ST machines, because the computer is unable to detect a media change with such drives. Although the Force Media Change program can be used to avoid that, this is unsuitable for game programs where the machine must be booted from the game disc.

Is there any other way of avoiding this problem? I would be very interested in a detailed explanation of why this problem happens and any issues related to it. It would be good if a hardware modification is possible to correct the problem.

Thanks.

Yes, there is one in CD-Tools by Julian Reschke. You can also use
HD-Driver 7.5x and a SCSI BOS-driver, as HD-Driver emulates SCSI on

IDE-devices.

I simply hardwired the HD-detect switch on the drive to pin 2 on the floppy cable. Works fine, but it's not that simple with drives that has optical detection ;-)

Hi Atari freaks,

I like to build an adaptor to connect an vga-monitor and an atari SM124
monochrome monitor to a falcon 030. How can I set the proper video mode?
Maybe the connectors "M0" and "M1" are the ones to set the video mode,
but I don't know what to connect there.

Can anyone help?

Regards

There are jumpers on some drives, to change the way the drive handles media change.

There is also a program called fmc.lzh or fmc.zip that forces a media change on each access. I haven't tried it, but it should solve the problems that some people have with PC floppy drives.

Cheers,
Nick

>
> Is there any other way of avoiding this problem? I would be very interested in a detailed explanation of why this problem happens and any issues related to it. It would be good if a hardware modification is possible to correct the problem.

On the Mitsumi drive that I have, I've bridged the disc detect switch and have had no problems with it since. The switch is on the left hand side of the drive, with the motor side up, with the connector facing you. On my particular drive, there are two markings on the board. WP for the write protect, which is the outside leg of the switch, and MS for motor select(?) The bridge should be made between this and the center pin on the switch.

Once this has been done, to verify that you've got the correct pins, insert a blank WRITE PROTECTED disc and try formatting it. If it formats, you've got the wrong pins connected. If it doesn't, cancel and open the drive window. Change discs and press escape. If it updates, the connection is correct, and all that needs to be done is for the covers to be put back on and the drive re-mounted into the machine.

I want to test STiNG and CAB with an old ZyXEL 1496E plus modem,
that is lying around here at work
(testing software before buying another faster modem and making
RS232 modifications).

This ZyXEL modem has some pin 6 with DSR which obviously isn't
delivered by ATARI Mega 2 (according to the manual of the modem
and some old DATA BECKER book).

Does anybody know, if both (ZyXEL modem & ATARI Mega 2)
are working together anyway?
Any experience with that combination?

Thanks in advance
ME

Hi folx,
I am a technician who has had an Atari 1040 ST (f model, not fm) machine
brought into work to be fixed.
As soon as the machine starts up, 20-21 bombs appear on the screen
(Hasn't even looked at the floppy drive yet).

Does anyone have the bomb information handy who can tell me what this
ammount of bombs mean?

Thanks in advance,
    Dave Smith
    Technician

My 33,600 modem recently got sick, so I took to an old fall back 14.4.
I'd been runnig at 57.6, or 38.4, but now I get faster transfers on
the old 14.4 modem at 19.2 port! An accidental discovery :/

>However, within the last few months, 57,600 rarely if ever works. 95 out of 100
>tries, I can't even get the modem to go off hook. But at 38,400, it works
>every time. The strange thing is that I never used to have problems at 57,600.

I have a similar experience, but can still get 57,600 rates as long
as I STICK to internal VGA resolutions. I.E. Videl Inside, even
with 2 color modes botches something up...maybe just hogs the
bandwidth of the bus? 115,200 will also work for me if I drop all
the way to ST High res.

Any Ideas of a fix?

Interesting. I just tried a new solution (mentined in COMP.SYS.ATARI.ST). I bought a new (shorter) modem cable. When I first tried it (un-modified Falcon in 256 color mode), 57,600 worked great. Then, later that same day, it would only go off hook 3 out of 10 tries when the port was set at 57,600. When I set the port to 38,400 or slower, there are _never_ any problems.

BTW: I'm running HSMODEM 7 (and also tried FAST_SER.PRG).

I'm thinking that either my Supra 28.8 modem, or the Falocn's serial port is (a little) flaky. What else could it be?!

I'm hoping that when I get my NEMESIS board installed (comes with some sort of serial port hardware-fix), my troubles will go away...

:-)   This is a composite error indication! The error handler fails, re-enters itself etc.

At this stage in boot the ST is trying to find out how much RAM it has and running a few simple access tests.

The usual cause is bad RAM access. Dry joints, de-coupler cap. gone, badly seated MMU chip etc. Best start off re-seating all socketed chips and checking for good DC to the RAM banks.

 Concerning the programming instructions, you can look at motorola website, for the M68000 Programmers reference manual (M68000PM/UM, i guess..) there you can find all instructions for the whole M68k family and some for the CPU32. There also are instructions for PMMU 68851 and for the FPU 68881/2

Ever wondered what those TOS error messages and 'bombs' on your
monitor signified? Below is a letter, originally written by Darryl
May, that John Townsend of Atari posted on GEnie in January to provide
some answers. This letter also appeared in the June 1988 issue of
_Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). (!nl)

Hi,

One problem could be, that the capacitances between 5V and ground are missing. This sometimes causes such effects.

reagrds,

Dirk Ortloff

Hi,

One way could be, to connect it to an SCSI port of a MAC without the adapter box of SLM 804 or SLM605. The input port of both printers are supposed to be SCSI, but I have never tried it.

regards,

Dirk Ortloff

Subject: IDE Quantum drive problem with AHDI and HDDRIVER - help!
Date: 1998/08/08
Message-ID: <8GH1C4V@tos.pl.net>#1/1
X-Deja-AN: 379124938
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.st.tech,comp.sys.atari.st

I have been needing to connect some IDE drives for members of our Atari user group, and I seem to be having even more problems.

This time the difficulties relate to a Quantum "Fireball" 5.1GB IDE hard disc drive. The drive works fine on a PC, but when connected to the Atari machine it just refuses to operate correctly, although other IDE drives work fine on the same machine.

I have tried to access the drive using both AHDI/HDX and HDDRIVER/HDDRUTIL, and following are the results:

With AHDI: I will run HDX, and try to partition the drive, but only to receive the message that the drive was formatted with "a previous version of HDX", and I am advised that the drive should be re-formatted. So I tried to format the drive with HDX, but HDX would crash with a bus error after about 10 seconds. What is going on here, is this a HDX bug, something I'm doing wrong, or what? Also what is that about the drive being formatted with a previous version of HDX?

With HDDRIVER version 6: When I choose to partition the drive using HDDRUTIL, the Partition Media dialog appears, and all seems ok except that the "bytes per sector" field reads 21298, which seems a distinctly unusual size, and that the capacity is listed as 2793.2MB (it's really a 5GB drive) but what's more: the "free" megabytes, listed just above the Help and OK buttons, is 203497.2! (I sure wish it was really that easy to turn a 5 GB drive into a 200 GB model!!) I tried partitioning it anyway, and everything seems ok, when HDDRIVER runs it lists "partitions C-x" where x is correct for the amount of partitions I used. However, the partitions are not accessible from the desktop - when you double click on a drive icon, nothing happens. What is the problem here, and can I fix it at all?

With HDDRIVER version 7, demo: I still can't access the partitions when the drive was partitioned with HDDRIVER 6, and I can't try partitioning it with version 7 since the demo version doesn't support that.

To make matters worse, even if the latest HDDRIVER version would correct the problem (which I don't know if it does), the person who bought this drive has just spent lots of money on his machine and really doesn't want to have to pay yet again for HDDRIVER, at least for now. He's already had lots of hard disc problems and he just wants the darned thing to work, as simple as that. He has AHDI 6.06 and would like to use the drive with that, even if the full capacity was not available perhaps, as long as the drive is accessible, in ANY form, it would be better than what he's got now.

Is there ANYTHING I can do to format/partition/do whatever is necessary to this drive so that it can be accessed with AHDI? Or else will HDDRIVER version 7 solve the problem? Or is there another driver that will work - what about CBHD - does it support IDE? I have suffered enough problems now with misleading information and unforseen problems, that I really don't know what will be enough to convince me that it will work, and I would hate to recommend to the person that he should buy HDDRIVER, if I have not seen it working with my own eyes. However I guess that's not possible. (I don't want to upgrade HDDRIVER at the moment, since version 6 is working fine for me, and if I always updated to the latest version it would get rather expensive, since the updates appear so often.)

Perhaps I could edit the disc with a sector editor and manually enter the correct partition info, if this is in fact where the problem lies. Or if it is simply that bogus sector-size mixing things up, maybe I could simplt correct that by hand? I am unfamiliar with the technical side of IDE drives so it's hard for me to judge the cause of these problems. If so, where can I find a disc editor that will operate on IDE drives (I have DADE but it doesn't seem to like the drive)? Or is there some free partitioning program, even if it's not a complete hard disc driver, that might help me?

I am absolutely at a loss as to what to do. Any help would be very much appreciated. I would appreciate it if you could also send your reply by email, as it may reach me much sooner and more reliably that way than via the usenet, and I need to get this sorted out as soon as possible!

Thank you for any assistance!

```

Hello All,

I am liquidating my studio equipment!

I have Atari ST�s, TT�s, Atari 19� monochrome monitor, MIDI software
including Cubase Score among others, an Tascam 388 8-track reel to reel,

out board gear and MIDI instruments. I have published the list of
equipment at: http://www.cape.net/glgallery/studio.htm

Please pass this URL to any who may be interested.

Thanks, Wylie Johnson (watchman@cape.net)

Are you sure? I've used UIS 3 for years and never had a DAT file. AFAIK, the configuration is saved into the executable itself.

Hello All!

I am using a NEC Multisync 3D Vga on my TT030. However no matter how much I play with the Horizontal/vertical controls, I still get a 2 " margin on each side of the display. I can live with it, but it sure would be nice to have more visability! Any Suggs?

Thanx

Hi!

This is a problem with the TT connected to a VGA monitor. If you want to ge=
t
rid of the black margins, you will need a graphics card or Overscan TT.

I am having a quirky problem with my Mega STe (TOS 2.06 4 Meg). It boots fine and runs okay, but after it gets hot, it starts acting up. The most noticeable symptom is that the file and menus names on the desktop start to get incorrect characters in them. For example the file name under an icon might read "Newfie" instead of "Newsie". Once this starts happening I also start getting bombs when I run a program (usually 2 bombs).

So far I have replaced the SIMMs and the TOS ROMSs and reseated the GLUE and MMU chips. I did notice that two of the SIMM sockets have the retaining tabs broken on one side, but the SIMMs seem to seat okay.

I'd appreciate any suggestions from those experienced with ST hardware problems. Please reply in e-mail. Thanks!

I sympathise! My "iiyama VisionMaster15" multisync VGA monitor has buttons to arrange the TT screen: horizontal, vertical, trapizontal (if that's the word?) height, width, left/right/up/down-shift etc. What I am suggesting is: explore the various control buttons on your monitor (tho' I don't know what they are!). I'm sure you'll find the right ones eventually :)

Cheers,
Charles.'

Does anyone know what the specs of the diodes are in the ST power supplies? I've checked in all sorts of databases, and so on, but no go. The broken supplies seem to be open, allowing the current to go both ways, which should not happen. It should go one way.

I've got an Atari 1040STf that is in need of a new floppy drive mechanism. I found a company that sells original mechanisms for about $99, but I think that's a little steep for a 720K drive. Can I use any standard PC style floppy or does anyone know of any other alternatives? Any help or information would be greatly appreciated. Thanks in advance.

Hi,

I need to buy a new modem for my Falcon (I had to give back the one I borrowed up until now). The question is do I wait until September when the ratified 56K standard modems will be available in the UK or should I just get a 33.6K?

From reading the thread on the maximum speed of the serial port it would seem that the Falcon will not make much use of the faster modem so I should save my money and get a 33.6K model. Is this correct?

Also, I understand that using a minimal screen resolution and colour depth will also speed things up, but if I want to browse the web, then 640x480x16(greyscale) is an absolute minimum.

I have a stock Falcon with no modifications other than the clock patch. I use HS-Modem and Sting.

Thanks for any information,

Michael

See my personal e-mail on this. You might want to copy parts of it in this group so that those also interested in this get to know more about it.

A friend of mine has a ISDN-modem and run at 115200 on his plain 14Mb Falcon using MagiC and PPP-Connect. He's using 800x600 in 16 colours without problems, and I can't see any reason why STiNG shouldn't do this as well. 256 colours *might* be a problem at 115200 though, but 57600 shouldn't cause any problems.

>

Errmmm .... do you mean the rectifier diodes? There is one in the primary (350v) circuit and a pair (at least) in the secondary which rectify the 5v and 12v.

For the primary rectifier you won't go far wrong in selecting a bog standard full wave mains rectifier which will take a 2A current and which is near-enough pin compatible with the PCB.

For the secondaries it's the same story really. The 5v rectifier should take at least 3A and the 12v at least 0.5A. The buggeration factor is finding the right package/pin configuration.

Do you have a local Maplin's? They have quite a variety. Otherwise a friendly TV repair shop should have some around.

Yes. Or even a 28k8 which you should be able to buy very cheaply from someone 'upgrading'.

You could even find that your phone circuits will not handle 56k - you would be angry about this if you had just paid new-price on a 56k modem :-))

I think you can use a simple pc drive.
Remove (solder) jumper DS1 replace DS0.
That's all, connect it in the same way.
It's ready for 720K. (HD only by fit HD-Module)

Watch the front plastic (mechanical)..

Regards, Robert

If you are in the UK you should try System Solutions on
01753 832212, they sell a mouse badged by themselves.

You can probably get one second hand, I even have a spare
if you are in the UK - make me an offer :-)

You can also use a serial mouse (PC type) with the right
driver software and/or adaptors.

These are the ones found on the heatsink between the caps and transformer.

In the Best Electronics one, they're not connected to a heatsink, as there's none, rather, just to the circuit board. In both boards, there's three of them, D2-D4 on the PCB. There's another small one, near the transformer, marked D1.

>For the primary rectifier you won't go far wrong in selecting a bog

These are regular 2-wire diodes. From what you're saying, a 350v 2A rectifier would do well.

>For the secondaries it's the same story really. The 5v rectifier
>should take at least 3A and the 12v at least 0.5A. The buggeration

Buggeration... heh... I see no other diodes except what I've described, and I've eyeballed them long enough to know. One blown supply I've seen has a diode on the 12V output.

The blown Best Electronics one seems to have a zener near the 5V output, marked DZ1, and what looks like a 1N914 in a cluster of caps and resistors, near the transformer, marked D6. I see no D5.

What are the specs of the big transformer?

>Do you have a local Maplin's? They have quite a variety. Otherwise a
>friendly TV repair shop should have some around.

I'm way across the other side of the pond, in the States. However, my city has a couple good-sized electronics houses, so it won't be a problem to simply drop by and pick up a few.

Now that we're at it, what are the most common failure points on these supplies, other than solder joints going bad? It is possible to somehow desolder every part on the board, and replace with all new parts.

If you use a 33K6 modem you can realistictly get a connection at 56K7 if you enable compression. With a 28K8 you'll get 33K6 and so on ... the line will be no more than the speed of your modem, i.e. 33K6, but _not_ 28K8.

I've got new problems with my old IDE drive ... I have a sector somewhere, that when read it causes the drive to spin down ... and not get up until next reboot. How do I mark it bad? I beleive it's some sectors following each other so I'd happily surround the spot with bad block marks, but how? Dedge and Kobold tools won't do it for me ... they get to the spind down part and then are unable to write down the markbad table.

Right, these will be the secondary rectifiers. The small one is prob. just used for regulating the DC levels. Does this PSU deliver -12v? Some do. If so the D2-D4 will be for +5, +12 and -12. Otherwise there may be two +5v levels in parallel.

>>For the primary rectifier you won't go far wrong in selecting a bog standard full wave mains rectifier which will take a 2A current and which is near-enough pin compatible with the PCB.
>
>These are regular 2-wire diodes. From what you're saying, a 350v 2A rectifier would do well.

Ah, it does it using 2 half-wave rects., does it. Yes, whatever. It just needs a full wave rectification of the incoming AC. Two diodes will do the same as a full-wave rect. package.

>>The buggeration factor is finding the right package/pin configuration.
>
>Buggeration... heh... I see no other diodes except what I've described, and I've eyeballed them long enough to know. One blown supply I've seen has a diode on the 12V output.

Ah, this comes of my not knowing the PCB. It is obviously implemented with simple components (not a bad thing!). The ones I have seen have 3 pin full-wave rectifier packages on the DC and the trick has been to find equivalents which fit the space and holes available :-)

>The blown Best Electronics one seems to have a zener near the 5V output, marked DZ1,

To regulate the 5v.

>and what looks like a 1N914 in a cluster of caps and resistors, near the transformer, marked D6.

This lot is probably part of the feedback circuit to the chopper which provides the main control to the DC levels.

>I see no D5.

There is sometimes a 6-pin opto-coupler around this area. It is often hidden under the large transformer. This is sometimes given a 'D' designation.

>What are the specs of the big transformer?

I have found it difficult to find replacements for these. They take switched 350v DC on the primary (could be half this in the USA, though) and have secondary ratios consistent with 5v, +/- 12v. The mark/space ratio of the primary is controlled by the chopper. I'm really not sure how you would describe such a beast.

>Now that we're at it, what are the most common failure points on these
>supplies, other than solder joints going bad? It is possible to somehow
>desolder every part on the board, and replace with all new parts.

It usually starts with a dry electrolytic in primary or secondary circuit. However, it is rarely as simple as this as the short caused will usually bring down a host of other components.

The large switch transistor.

The controlling transistor in it's base circuit.

The main fuse.

Any of the rectifiers ....   it's a hell of a job! I have regularly blown up a load of new components before getting it right.

Hallvard,

Does this particular drive still allow you to read and write SS 360k floppies? I know a lot of modern drives no longer recognize this format. Thanks for the info.

Sincerely,
- Byron Followell

I disagree ... a bit. I have 56K modem and I can use it in 42K mode without
troubles. It's not much more but still more than 10K to 28K modem.
My system is Falcon 14Mb with Nemesis.

I don't think there is a direct midi interface but you could maybe use
a serial midi interface with the portfolio's serial interface.

Perhaps someone with experience might have the answer for me about a Segate ST11200N SCSI 3.5 full hieght Hard Disk Drive that will not allow me to access the partitions when I re-boot with either ICD or HDDRIVER, the controller reports that the drive is on the chain but no partition information is shown. When I try an IDCHECK, it is reported on the chain. But when I try to access the drive to either format or write partition information, the drive is not shown as available. I normally use ICD 6.5.5 and have tried 3 different versions of HDDRIVER and a couple of different versions of AHDI and the only error that has been reported back is.... Sense Code $04   I have noticed that it takes quite a long time for this drive to report that it is ready (the LED stays on for a long time when first powered up). Am I to assume that the controller is faulty and this drive is now land fill? Thanks.

Sorry to post here.

I used to have my old SLM 804 conncted to a Mega STe using the little SMM804 adaptor box. Worked fine most of the time.

Recently got this TT (4/4/540) and tried connecting the SLM and the adaptor box to the TT's DMA port. Bad move. Lot of bombs at bootup. Try disabling this or that CPX, ACC, AUTO-PRG, whatever, no success.

Is there a trick to getting the old laser printer to be recognized by the TT?

I don't have an 804, but I do have a 605 and use it with no problems on my TT. They use the same adapter box, so you should be able to use yours as well.

The 2 things I would do right off are

1. Check the dma port with some other unit (atari hd etc)
(It's possible your port is bad)

2. Open the SLMC804(the adaptor) up and see what it's SCSI ID is set at. Your TT also has a SCSI ID, it's possible that they are set the same. Which would indeed lead to trouble.

Hope it's just the SCSI Id.

Hello Michele,

the described problem sounds like a memory problem. It could be that some of your memory chips/sims have a problem or that the MMU is broken or not properly connected. If you have an old ST remove the MMU and clean the pins softly with a rubber. This normally helps.
If you have still problems, please reply!

Hi all

Can someone tell me where (ftp) that i can get linux 68k,
i have a 100mb partition free, 16mb and can get an fpu,
what files will i need to download.
i think i will ne to compile my own kernel as i have nemasis on order.
thanking everyone in advance.

cheerz

Two half-waves? There are THREE of those big diodes, not two. Are they
350v 2a specs?

>Ah, this comes of my not knowing the PCB. It is obviously implemented
>with simple components (not a bad thing!). The ones I have seen have 3

Hmm... Must have been the newer power supplies. I've not seen any full-wave bridge rectifiers, unless I'm looking in the wrong place, and unless I'm thinking of an SCR the wrong way...

>There is sometimes a 6-pin opto-coupler around this area. It is often
>hidden under the large transformer. This is sometimes given a 'D'
>designation.

Yep. There is, on the Best Electronics one. There's a second one near the 120v input, a 4-pin. The other blown supplies have a 4-pin chip. In every case, they're right next to the transformer.

>I have found it difficult to find replacements for these. They take

>will usually bring down a host of other components.

I replaced some electrolytics, and a few resistors, and will be replacing the large transistor on the heat sink. Then maybe to replace those three diodes on the other heatsink, once I get all info about them.

>The large switch transistor.
>
>The controlling transistor in it's base circuit.

Where are these located, that is, what designation on the board, like R1, that kind of thing?

>The main fuse.

I blew this once. Totally scared the heck outa me.

>Any of the rectifiers ....   it's a hell of a job! I have
>regularly blown up a load of new components before getting it right.

But of course, I will have to see the schematics, as it'll help.

It isn't a matter of whether a drive recognizes a SS disc, as all the drive does is to read what's on the disc, not interpret it. The machine that the drive is connected to is the one that tells the drive where to look and as all Ataris have the same, or compatable, disc controller, all Ataris should read a SS disc.

Mine did the last time I used one, which was about a week ago when I tried my hands at Dungeon Master again.

BTW, the drive I'm using now is a Mitsumi, which replaced a Sony, which replaced the origonal Epson drive. All three drives have read/writen to SS discs without any problems.

Does it bomb when the SLM specific tools are started? In that case, you probably have to update the diablo driver to a newer release (the latest is 1.6).

Hi everybody

Because my old monitor EIZO 6500 passed away, I bought a EIZO 6600 and screwed an ECL to VGA converter together.
Now, the result isn't that bad but I'd like to correct it a little. I need better documentation for both the parts used inside the TT and - preferably - the schematics of input circuitry the TTM194 or TTM195.

1. Has anyone documentations about the ECL driver DP8516V? National feels sorry about having NO info left about the device. It's all about the maximum current I can draw thru the inverted and noninverted outputs. I'm now using 1K resistors tied to -5V which seems to lead into reflections - quite obvious when 75 Ohm cables are terminated by 1K...

2. With the schematics of the input circuitry of the TTM194 or TTM195 as reference, it should be possible to make a better converter than with the AD5539 I'm currently using. Can anyone make a copy of the schematics?

3. Are there already solutions for the problem? I don't like to reinvent the wheel once more...

Regards, Martin

Do you know a ftp site where I can find the diablo 1.6 Version? All
diablo16.zoo files I have got are maybe damaged, or my zoo is too old!
A Maus Box will be also suitable. :-)

Ciao Ralf

If you mean that you want to turn MagiC's preemptive multitasking off while the rest of your progs boot then you have to _add_ the line:

;#_TSL 1 32

in your magx.inf file before the #_CTR flag - note the semicolon!

You then use the timeslice cpx to turn preemptive m/tasking on again (just having the settings you want saved in the CPX is enough, you don't need to load it every time).

OK, OK, ISDN-*adapter* ;-) But it *does* talk to normal modems and faxes as well, so I'm partially right.

If your interested in purchasing my Falcon then feel free to e-mail
me an offer and it will be considered.

1 Atari Falcon 030/4 megs/80 meg hard drive
  All manuals and language disks
1 expansion board made by Computer Direct (14 megs, ram not included)
1 Notator Logic and Logic Audio + Log3 Dongle + manual
Atari MultiTOS and SpeedoGDOS
Atari Works + manual
Geneva by Gribnif Software
Warp 9 Software Accelerator
Pagestream 2.1 + manual + 10 disks of fonts
Touch Up
Lots of extra disks with shareware programs

```

Yes, xfree68 the current xwindows system for Linux m68k.

Debian is ~ 1500 packages (ie: programm)

Get this file (300Kb):

ftp://ftp.debian.org/debian/dists/unstable/binary-m68k/main/Packages.gz

Unzip it, and see what is available.

Bye, Ian
Christian

Where is the Magnum from? I asked Titan weather it was possible to exceed 14 meg and they said no and that the Magnum would never see light of day. I would kill to get 64 meg into this old girl. I play with some rather large scanned images. Does any one know where to get one of these and how much??

G'day, try using fcopy Pro, I think it allowed you to set the step rates to 3 or 6ms.

No hack is needed, the serial-port runs at 19200, 38400, 57600, 115200
and 230400 (and some other rates, but these are the most used) without
any mods at all. You should install HS-Modem 7 to get it to work
properly, but the hardware doesn't need any changes.

Not that I'm aware of.

>Or is an DMA to SCSI TCP/IP-Driver existing ????

I had this idea of writing a TCP/IP driver for MiNTnet using the
SCSI-interface in SCSIDRV/HD-Driver. If I ever do that it should work
with all hardware, although it might require a modern SCSI-adapter
depending on how SCSI TCP/IP is implemented on Linux.

Somebody at work told me that an SC1224 color monitor can be used for a Sony Playstation. He said I need an "adapter cable" and that's all he knows. Is this true or should I reformat my co-worker's computer? Thanks.

I have a similar question:

I've got a Megafile 60 and a Megafile 30 plus
an ICD Advantage ST Host Adapter.

Now I want to connect an EXABYTE EXB-8700 in the following way:

ATARI Mega 2 -> Megafile 60 -> Megafile 30 ->
->ICD Advantage ST Host Adapter => EXB-8700+SCSI Terminator
("=>" means SCSI connection,
 "->" means DMA connection)

so that I can backup all my files from the
Megafiles to the EXABYTE and then put them from the EXABYTE
onto my Seagate ST1480N harddrive (after replacing the Megafiles).

I guess I have to give SCSI-ID >0 (since the Seagate HD will have this)
and <> 6 (the SCSI-ID from the ICD Host Adapter) to the EXABYTE.

I already got gemar306.tos, gemar300.zip and gemar220.lzh from ftp
(which one is best ?).

Is this possible at all?

Thanks in advance
ME

P.S.: Thanks to all those who helped me some month ago.
The Seagate ST1480N, the ICD Advantage ST Host Adapter
and the Mega 2 are working together well up to now.
I just have to transfer the files now...

See my website for SEEKMS v1.00 which will run in the auto folder and set
the seek rate of drives A and B to 3 and/or 6ms.

Toad Stealth Kit - $25
Shipping in the US, add $7
Shipping to Canada, add $9

What it includes....

1 Black Toad SCSI Case shell suitable for 2 3.5 inch low profile SCSI drives.
The case is made out of metal.
1 Length of SCSI Cable
2 Internal SCSI Connectors (50 Pin)
2 External SCSI Connectors (Centronics)
1 Toad Power Boards (Bare)
1 Power Recepticle for about board
1 External Power Supply
1 Set of 4 Feet for the case
2 SCSI ID Selector Switches

Note, the above list is not finalized, more pieces might be included as I
can locate them, or purchase them in bulk, but the pricing is firm.

What is NOT included and might be needed....

Tiny fan for ventilation (Radio Shack has these for about $10)
Power Connectors from the Power Board to the Hard Drives and Fans
Front Triangle LEDs (I can't find them)

Instructions for assembling the Power Board
Any resisters required on the Power board
2 SCSI ID Selector Wires
Standard Power cable from the Power supply to the Wall (Same cord as All STs with internal Floppies use).
Screws for the case (Unless I can magically produce some).
Spacers for the drives (I might be able to get these though).

The power board will need soldiering. The power connector, any resistors required (I have yet to get any instructions from Toad, and I haven't been able to find anyone with a fully assembled Stealth drive.)

If you have ANY questions at all, please ask, I don't want anyone to purchase this kit with any concerns. I will still work on getting some schematics for the power board, and post them on my web page.

BTW, this will only work for TOS 1.04/1.4 and higher, as I used the new
floprate() (XBIOS 44) for the curious). This means it works with (Mega)STEs,
TTs, Falcons and any machine using Magic. I don't know which version of TOS
this call was added, but it's probably safe to say pre-TOS 1.04 won't work.

I'd forgotten this so, apologies if I raised anyones hopes to high.

Hmm. I guess you are luckier than I am. I used to be able to set my serial
port (reliably) to a maximum of 57,600 using either FAST_SERial or HSMODEM.

However, within the last few months, 57,600 rarely if ever works. 95 out of 100 tries, I can't even get the modem to go off hook. But at 38,400, it works every time. The strange thing is that I never used to have problems at 57,600.

However, I've _never_ been able to get it to work at anything faster than 57,600. And I've heard that 115,200 and up only works with hardware mods (ie. Nemesis board allows these rates).

Hello,

I'm having trouble getting the 2.61 version of the Nova drivers to work with my Nova32 on my TT. It seems to be a distribution for VME, but it hangs my TT right after the STA-VDI boot message, even when I run no other auto prgs.

Has anyone else had this problem, and can it be solved? Does anyone know where to get a newer version of the driver?

Thanks,

Dan

I use a CD-ROM drive Sony CDU-76S SCSI, and all programs i tested, say
that my drive doesn't support Audio command....ie, i cannot perform an
import of a digital track to my HD. Is it my drive which cannot do it or
is it my driver (SPIN + Magic 5.13) which cannot allow this operation ?

The SC1224 is a quite standard (except for the connector) RGB monitor.
It can display anything that has an RGB output. If the playstation has
such an output, then it should work. You'll need the pinouts of the
Atari connector and those of the Playstation connector.

Check out:

http://margo.student.utwente.nl/stefan/hwb/menu_Connector.html

Cheers,
Nick

No problems, you can connect your playstation (hummmm!) to your SC1224, because
i connected my jaguar to a Commodre 1085S, which is RGB. You need to connect the
R, G, B , GND, and sounds signals to your monitor.

My brother connected its Playstation to the a commodore 1085S.....

hm, i�ve got a 1084S at home. i planned to use it with my ST for playing
games :-).
but i didn�t get it to work. are you sure i will only need R,G,B,GND and
sound signal pins? no sync signals at all?

Yes, that's true. Of course you should use a short RS232-cable, that means not more than 3 m, and should avoid any cheap RS232-switches. I do not say that 115200 bps with 10 m cable will never work, but it depends.

Anyway, the mentioned rates reflect only the capability of the SCC with the given clocking, not the reaction-times of the CPU. The original Falcon CPU is very slow. Worst case it is even slower than a simple Atari ST!

Although I have read that people use Falcon MODEM2 at 115200 bps, my own experience (years ago) was that 38400 bps was the highest usable rate in VGA mode and 57600 in ST-high monochrome mode.

Regards, HS

I'm using a CDU-76S on a Falcon with SPIN 0.34 and Magic. AFAIR when I tested it I could copy Audiotracks to the Harddisk using the CD-Player by Alexander Clauss.

thats interesting. i recently used 115.200 with hsmodem7 on modem2, and it worked well the first time (maus). but when i tried it once more a few days later, i found that the transmittion speed started with over

2000.. aehm.. kB??? and then it slowed down below 1000 kB continously.

hm, perhaps i should try again at slower settings.... >:~]

I have used 115200 without any problems with a 15m null-modem cable (cheap TP-cable). I would have tried 230400 but the PC at the other end couldn't cope :-)

> Anyway, the mentioned rates reflect only the capability of the SCC with the given clocking, not the reaction-times of the CPU. The original Falcon CPU

Exactly. I have an Afterburner and naturally has no problems with slow CPU in this respect. I remember back in those days when I still used CoNnect (now I use MiNTnet/pppd) on a stock 4Mb Falcon. With TOS/Geneva I could use 57600 without problems, and 115200 also worked as long as I didn't move the mouse. With MagiC!4 I could move the mouse without loosing characters, but since MagiC!4 crashed every 30 minutes on my Falcon I soon dropped it.

When I installed a Speed Resolution Card I could use 115200 even with TOS and MiNT, but used 57600 just to be safe (I had a 14k4 modem anyway). Since I got the 28k8 last year I've used 115200 without any problems on a 030@20MHz and later the Afterburner.

Just want to clear up some things here...

* You *can* connect the PSX to a SC1224, but not without some electronics. The SC has separate horizontal- and vertical syncs, while the PSX has composite sync. So in order to connect the PSX to an SC you must split the composite sync into hsync and vsync. Don't ask me how, but you might get help with this in some of electronics-newsgroup.

* The 1084/1085 has composite sync input, as well as composite video and some other stuff (e.g. digital RGB). It doesn't have separate v/h sync inputs though, but thats generally not a problem. So connecting the PSX or Jaguar to a 1084 is no problem at all.

* You *always* need syncs, otherwise you won't get a picture. To connect a ST(e) to a 1084 you have to do something like this:

```
 ST            1084
 ------------------
 Red           Red
 Green         Green
 Blue          Blue
 Hsync--|>|-+
            +- Composite sync
 Vsync--|<|-+
 Ground        Ground
```

The "--|<|--" is my pathetic attempt to draw a diode. This has worked

fine with both my STE and Falcon, although you might have to reverse
the diodes to get it right. Btw. perhaps the diode-trick can be used
to split composite-sync as well? It's worth a try.

I think the composite signal is used for sync.

I think it's certain to be the drive, Laurent.

I had the same problem with my IBM CD and asked about it in csas. I tried with Spin and Extendos.

If the drive is more than about 18 months old then Direct Data Sampling would not be supported. I wish someone would cook up a program which would display a drive's capabilities.

Hi!

I realize this is ancient stuff, but i can't hone in on the info i need, so please help me if you can.

I am attempting to increase RAM in an ST from 512K to 1M. The board is marked: ATARI 1040ST REV. 2. I've installed 16 256K chips, 16 caps, and 3 resistors. The computer works, but still only detects 512K. Are there more components or connections that i need to make?

Thanks for any help you can provide.

Wayne

My own experience has been that 115200 is reliable in 16-color and less RGB modes, as long as you don't do a lot of multitasking. In high-color modes, or when doing a lot of multitasking, 57600 is the highest you want to go.

>Urrrgghh! Are you sure you have the right protocol set, Paul? RTS/CTS?

Yes, it's set correctly. And right now 38,400 seems to be the only
reliable speed my Falcon will do.

I have two 520 STs (one w/ 1 meg and one with 4 megs of ram), one MEGA STE (w/ 4 megs of ram, TOS upgrade and floppy drive upgrade), two SM 124 monochrome monitors, two SC1224 color monitors, one external floppy drive (for the 520s) one IDC scsi hard drive controller, one MIDI plexer box, one SMPTE sync box, one SMPTE sync card, lots of software and all of the cables and power supplies. I'm asking 475.00 OBO for the whole thing. I will consider parting some of it. Everything works.

If interested e-mail me.

The size of the memory is set by the resitors (I think there is no other detection).
One or more resistors might be in the wrong place.

I have a selection of Atari ST titles for sale.

This List Updated 25/7/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

I have some 1 meg SIMM's ideal for upgrading your STE or Extra RAM
Deluxe upgrade board.

Upgrading from 512k or 1024k/1 meg to 2 meg .... 10.00 UKp (Sterling)

Upgrading from 2 meg to 4 meg .... 10.00 UKp (Sterling)
Upgrading from 512k or 1024K/1 meg to 4 meg .... 17.50 UKp (Sterling)

Along with the memory, you will get fitting instructions and a disk of utilities.

Sorry, UK and Europe ONLY.

Cheers! for now
               Steve

FS: I am selling a bunch of my Atari stuff in order to raise some money toward the purchase of a TOS clone. I haven't decided which clone to buy yet, it'll be a toss up between the Milan and Wizztronics machine.
I have divided the stuff up into two groups. The Jaquar Group and the ST Group, and that's how I want to sell them. I live in Loudoun County, Virginia which is in the greater Washington, D.C. Metro area, so I'm looking for buyers primarily in that area , it'll cut down on the cost of shipping :).

JAGUAR GROUP
Complete Atari Jaguar
Complete Jag CD
11 Carts and 3 CD's

ST GROUP

Complete 520ST with 4megs of memory
19 Programs, 27 games, and 1 joystick

Interested persons may email me at: Seahawker@juno.com
Thanks,
Sam Ferrer

No.

It is more likely that CAS1 has not been connected to the new bank so
that it is never selected by the MMU. However, without a look at the
board, I find it hard to describe what to do!

Hello,

My TTM195 is down for the moment. All I see is a small vertical white line from top to bottom.

Anyone knows if the TTM can be repaired?

TIA
Martin

Thought I recalled a jumper or resistors had to be installed in the line that enables the bank.

I have an Atari 1040ST music computer. I am using Mastertracks Pro MIDI sequencing program. My computer periodically locks up. I am in search of someone who can repair it so that this does not continue to happen. Can anyone help?! I am looking in the areas of Chicago or Cleveland. But can possibly ship if nothing in these areas.

Thanks,

It'll probably be cheaper to buy a second hand one (dead cheap now!).

Yes, that's right. It will be in the CAS1 line and is usually a jumper.

The only point I was arguing about was that the 'size is set by resistors' which sounds as though there is some sort of 'coding' going on. It's not, of course, just a plain 'enable chip'.

> other auto prgs.

I guess thats the problem. You must run emulator.prg and menu.prg BEFORE
STA-VDI. The running order is very important:

EMULATOR.PRG
MENU.PRG
STA_VDI.PRG

NVDI (for GDOS) or SpeedoGDOS etc.

Remember the files named MENU.INF and EMULATOR.BIB.

Since I notice Harun Scheutzow is now reading this newsgroup,
I thought it would be a good time to ask:

* Whatever happened to the expected HS-Modem 8 ?

* When is Harun gonna release the sources, so that someone can make loadable drivers (XDD) for MiNT ?

  He suggests people who feel capable to handle the port contact him, in HS-Modem 7 docs, but after several emails from myself and others, nothing happened.

Can he please answer this one? Thanks.

i agree. i cannot see any reason to couple the h- and v-sync via diodes
to build a comp-sync by myself (like jo explained) when the monitor
output of the falcon already delivers a comp-sync...
anyway, i think i tried this, and i�ve checked the selfbuild adapter
cable about five times, but can not find an error. maybe the 1084S is
the problem. it was stored in a cellar for a couple of years.
i tried to use it with a video camera/cutting epuipment by using the
backside video/audio/chroma inputs, but it didn�t work. these connectors
do not seem to be wired to the switch on the front - which isn�t mounted
already.... :-(
bad machine, i�ll give it back to where i borrowed it.

Using composite video for sync didn't work with my 1084S. It doesn't
work with my TV either (it loose sync when the image is too bright) so
I used the diode-trick with great success.

Hello to all Atari users,
I am looking for software in order to make my own cd's, audio and data
using a Falcon 14MB. Which scsi cd writers are supported ?
There was a relative topic in the news last month but had expired. How
can i find it ?
Thank's Nick

ah, that might be the trick!
well, i think i�ll try this (why not?) - when i �ve got the time....

thanx, -micha-

I bought a 520 stf, but I have no peritel cable to plug on my tv, I would
like to have the connection on the 13
pins connector (video connector) to make a cable myself
thanks
alex

ps: sorry for my english, I'm french

Somehow it's got to be a configuration error. Perhaps the NVDI 5 installation did not read the old config and set everything as it was before.

i think you'll need a hack to run at 153k6 ;) I've never heard of that speed before.

Anyway, there's no problem running 115k2 at a stock Falcon in RGB or VGA if you use MagiC 5.x, but perhaps in TOS 4.0x. I use only 16 colours to get fast display updates though, never thought of that it could affect the modem speed. I've only used that high speeds for null-modem transfers though, I don't have ISDN .... and 56k7 modems go fine at 70kbps.

Tu trouveras les brochages des 2 connecteurs dans le Quick FAQ:

Pinouts for both connectors are in the Quick FAQ:

http://wwwperso.hol.fr/~nbales/quickfaq.htm

Cheers,
Nick

Anyone know where I can find the latest version of this program
(besides the manufacturer's German BBS)?

Hi

If you have an STF, you will not have the RF output to connect it to a tv. You will either need to use a colour or mono monitor or get the appropriate modulator.

If your TV has SCART or composite video input, I think the quick ST FAQ covers this.

Cheers! for now
               Steve

Euch I don't get this. If wdialog is build in I suppose I'd be able to
configurate the printer settings from the printoptions in Cab 2.70. Well
without wdialog I just can't do any configuration. The "option" box isn't
available.
Anyway without WDIALOG I still get the problem. Even with a 307 MB
free partition NVDI complaints there isn't enough space available.

BTW: I'm not using MagiC but the superb N.AES

> One or more resistors might be in the wrong place.

The thing I think is more likely to have happened is one of the chips isn't seated correctly, depending of course on whether sockets have, or haven't been used. That was one of the problems I had when I did my upgrade many years ago. The second problem was one of the chips had suffered from static damage and needed to be replaced. Once that was done, and all of the chips correctly seated, it worked okay. This was with a Rev. B board which has the chips located under the power supply.

BTW, if you want to know how to find out which chip(s) are static-damaged, look above $80000 with a debugger, like MonST, for words that aren't zero'd. In the case of my Rev B. 'FM, with the chips laid out as below the bits that are set identify which chip isn't working:

```
        Back of machine

$80     41256 c   41256 c
$40     41256 c   41256 c
$20     41256 c   41256 c
$10     41256 c   41256 c
$08     41256 c   41256 c
$04     41256 c   41256 c
$02     41256 c   41256 c
$01     41256 c   41256 c

        Col 3     Col 4
```

If a word shows $4008, this means that the second chip from the back in column 3 and the fifth chip in column 4 are either defective or aren't seated correctly.

If, after checking to see if the legs are correctly seated, and reseating them if they're not, the values still aren't zero'd, replace the chip with a new one and check again.

I guess more detail would have helped...

I was using v2.08 just fine, except it won't work _at all_ with NVDI. I tried upgrading to v2.61 (with emulator and menu), but if I try to use more than 16 colors, I just get a white screen and the system no longer responds.

This happens even when Nova is the only thing run.

Are there any other up-to-date Nova 32 owners out there?

Good luck on the cart. You may have to find an Atarian with a broken
scanner. I have a copy of the software I can e-mail if you get a cart.
(Obviously the cartridge serves as copy protection, so no anti-pirate
flame, please).

It is possible, even without the Afterburner. I have a Mighty Sonic
that accepts 32mb of fast ram, and it dosen't matter if I have 4 or
14mb of ST Ram installed. Robert Schaffner is using an FX and is as
close as you will get to an English speaking expert on the subject. I
do remember that with the latest FX software drivers, there is a
configuration that allowed 24mb of RAM that I think he uses.

(sheepishly) hi,

i discovered that i placed one of the memory chips in backwards! (And was unable to repair the damage with my limited skills and tools!)

Thanks to all of you who were so kind to reply to my plea for help -- John, Roger, Jerome (and anyone else that i've forgotten to thank e-personally).

Wayne

Hi,

>Is it possible to run MiNT with 2 MB RAM (ATARI Mega 2)?

MiNT itself will run quite happily under 2MB RAM. 2MB starts to become a little tight though when you add to this a multitasking AES and replacement desktop etc or you install a MiNT distribution such as KGMD.

It depends on what you want to do with MiNT.

Hope this helps.

Regards,

Ben Hills.

I planned to install KGMD and use MiNT as normal working
base (window manager(which one?),some X11R5 hacking,
some use of modem+appropriate software...).

Is there another (possible better and less memory-consuming) version of MiNT for the Mega2 ?

> Hope this helps.

Thanks for the 1st info.
Did anyone ever test several machines with different memory configs and MiNT?

Thanks in advance

Hello,

I want to connect a modem to my Mega 2.
I know that this is probably a bit slow with the 19200 limit.

Is there a possibility to set higher rates with MiNT?
Or is this a hardware limit?

Are there any SCSI-modems which I could connect to my
ICD AdSCSI ST adapter (thanks again to all the helpers in this NG
who provided some pointers for connecting the ICD AdSCSI ST and
a SEAGATE ST1480N - up to now it works perfect).

I know that SCSI is probably a bit of an overkill since the
telephone-line (not an ISDN) is not that fast anyway,
but I'd rather like to move the bottleneck to the telephone line
and blame the telephone company ;)
than getting bored by the modem <-> computer connection...

Thanks in advance

Hi !!

I am looking for the object file formats for the different compilers on
the ATARI computers.
In particular, I am interested in the formats of
PureC, PurePascal - containing the debugging info stored in the object file. Is there any Profiling info stored in the object file, so that PureProfiler can work with ??
MegaMaxModula 2 - for the definition modules and the implementation modules, also containing debug info, if applicable.
GNU C/C++/ObjC - Also need "full details" about the object files.

Any other object file formats are also greatly appreciated.
I am currently writing kind of a ReAssembler, so I need to know anything
that is available about all the object file formats available on the
ATARIs. Is the *.LOD file's format for the Falcon DSP modules anywhere
documented, or do I have to ReAssemble the Falcon ROMs to get the info I
need about ?

4Mb is barely usable, 2Mb is unusable for such things that you mention. E.g. X needs 4Mb just to start, and then you'll only be able to open a couple of xterms.

> Is there another (possible better and less memory-consuming)
> version of MiNT for the Mega2 ?

MiNT itself requires something like 200Kb. The rest you mention is only programs and collections of programs that needs MiNT to work. If you want to use MiNT on your Mega2, then place mint.prg in c:\auto. Then it's up to you what other stuff you want to install. But for something unix-like, perhaps with compilers, perl etcs you really need 4Mb, preferably more. My MiNT-setup is probably as comprehensive and complex as it can get, and it use 10Mb just to boot...

With 2Mb I would suggest to install the MiNT kernel itself, MiNTnet, MinixFS and some basic daemons and clients to get it up and running on the net (syslogd, pppd, smail, mutt, telnet, ircII). Forget X, GEM etc.

> Is there a possibility to set higher rates with MiNT?
> Or is this a hardware limit?

MiNT itself supports any rate up to 230400 IIRC, but the Mega's hardware is limited to 19200. There are hacks to increase this to 38400, or you can install better serialports which will manage 115200. The ST is really too slow to handle this correctly though, I'd say 38400 is the practical upper limit.

> Are there any SCSI-modems which I could connect to my

I have never heard of something like SCSI-modems, and I doubt they even exists.

Oeps I maked a mistake I see. It should be 219.725 kb. Which is reasonable
large I think. Even with 312.000 kb free space I can't print.

I remember I did it once quite some time ago buth then I was using NVDI
4.11, Wdialog 1.98, Cab 2.5  and MiNT 1.12.
Nowadays my setup has changed a lot.

Newsgroups: comp.sys.atari.st.tech

I have been experimenting with Sting setting up a local network lately and have problems with lost packets on Serial2 on my Mega STe.

Modem2 is rock solid at 57600 connecting to my provider.
Modem1 is rock solid at 19200 connected to a Stacy.

Serial2 looses almost no packets at 38400 connected to a Win-95 pc if I run under TOS with blitter disabled. If I run under Geneva+Neodesk

things start to get worse. It is still possible to run the pc-browser
(MSIE) but due to the lost packets it gets to slow for my taste (and
wallet :-))

I do not have Magic but have a feeling that it would improve things?

What about installing a ESCC chip? Are they readily available?
I have not checked if the SCC is socket mounted. I suppose the inbuilt
buffers would solve this completly?

Apart from this little problem my little intranet really runs very well.
Because of the the improvements in the Okami+Newswatch+Popwach combo I
actually prefer to use them than the Microsoft alternatives. But it
would be nice to be able to browse with the pc at full speed without
having to switch cables all the time.

I dug an older model SGI Indy out of the junk yard on base and want to try STonX. I'm not sure of the processor, but it's one with the blue case. It has 64mb of ram. I installed IRIX 5.2 (?) from a SCSI CD I rigged up to it, but it dosen't have a floppy or optical disk, so everything has to be loaded by CD (until I get an IP assigned to it). I was wondering if a MiNT NFS EZ135 cart would be readable on this machine? Sure would make loading software a lot easier. I'm hoping for a little more compatibility with older apps than MagiC Mac offers using either an image of my Rainbow TOS or TOS 2.06.

Thanks for any advice,

Mike

You mean a EZ135-cart with minixfs? It could work, most systems are able to mount minix v2 filesystems. You'll just have to try.

:(

Hmm, I just consider not installing MiNT at all
if 2Mb is such a low environment for MiNT.

Which other possibilities do I have to get into the net
(software for WWW, email, ftp, telnet?) with pure TOS/GEM ?
Are there any?
I know that the 19200 will be a pain...

STiNG, NEWSie and CAB should work with 2Mb, although it's still a bit
tight.

There is a 38400 modification you can do, fairly simple.

You might also consider Hsmodem & the more complex RSVE modification. AFAIR, RSVE + Hsmodem will allow an 8 MHz ST to reach 57600.

You can find information concerning these & more serial port ideas on Hallvard's excellent web page:-

If you wanted it just to access the net, why didn't you say so in the first place ;-)

Have a look at the Quick FAQ everything to get you online with TOS/GEM is in there.

I'm quite sure that a simple text based net access is possible with MiNT and 2Mb, MiNTnet and Lynx, FTP and some simple text based news/mail software if there is any.

Cheers,
Nick

Hi All, I remember there was a company in Germany that had a TOS computer
mounted on a pc board called "Janus" I believe...does anyone have more
information on it? Thanks.

Miles...

Hello,

Was the hd63463 mfm hard disc controller (or compatible) ever used
in a microcomputer such as an Amiga or Atari?
It was used in the Archimedes (Acorn) ten years ago (A4x0).

I don't have data sheets of the controller and I am wondering if
it is possible to read ST506 hard disc which are formatted with
the 'pc disk geometry' (i.e. 17 sectors, 512 bytes/sector)

cheers,

Stefaan

  Hi Kenneth,

  I am not sure it is related to your problem but :
  A lot of Mega STEs suffer from a hardware bug related to the SCC. Things seems to work, but corruptions occur to the data transmited by the SCC. Since I had the corrected GAL in my Mega STE, I never did had any corruption, and data transfer is nearly twice as fast, because I no more have dropped packets.
  One thing I noted before I had the harware bug corrected: the faster my provider was, the slower the connection was, so that sounds a little like your problem.
  So maybe you should check this.

  Hope this helps,

Well, there were some ST506 controllers there - one was the A2090 if i
remember it correctly. And some others (e.g. external) with some
horrible hack to use an ISA card (where some of them didnt even have a
real name...)
And it should be possible to read the PC Formated drive when its
attached to a fully running system (at least with AmigaOS 2.x and
higher).

This is the plain old a.out format. See man a.out on any BSD derived
system (eg. Sun3/Sun4).

Well, it would have been nice to do some work on a UNIX-like environment
on the ATARI, but it looks like I have to upgrade the memory for that.
As soon as I can get connection to the SUNS (telnet)
this means that I can do some work.

Thanks to you and all the others.

Thanks for the info!
I does look like this bug is present in my machine. I did some searching
and came up with FSER096B.LZH by Franz Sirl. It has some info on how to
fix this bug. Hopefully I will find the hardware to fix it.

I'm sure it can, I can't help you much here in the USA, but I can give you a
couple of ideas. Take it to a monitor repair shop, if none available, find
the most capable TV/Electronics shop around your area. They may need your TT
for supplying the video signal to the monitor for testing.

As for what causes the | vertical line down the middle, it's a simple matter
of no horizontal deflection. Most likely cures: Bad solder joint on the yoke
plug, or shorted horiz. output transistor, or loss of drive pulse to the
horizontal output transistor, or loss of B+ to the horizontal output
transistor, which could be either a bad solder joint, a defective B+
regulator, or some other power supply circuit failure.
                                        Good Luck ! ........ Dan Valega

I have had the same problem.
If your mouse cable is long you have to shorten it. In my case it helped.
I was told also that pulling all 4 signal wires up to +5V with 1 Kohm

resistors is very effective, but I didn't try this methode.

>know if I can use a standard PC mouse if I rewire the plug.
>If so, does anyone know how the plug should be wired?

The answer is blowing in the Quick FAQ...

It's better to use an ST mouse, but I don't know how easy it can be to get one in NZ. You can use a PC serial mouse on the serial port, but with a special driver. It probably won't work with games though.

You can also rewire a PC bus mouse, but those have disappeared eons ago. You cannot rewire a PC serial or PS/2 mouse, which are completely different beasts altogether.

>Any help would be greatly appreciated. Are there any commercial games
>still available?

Yes, but not many. Obsession, Substation. but they require at least an STE with 1Mb.

Cheers,
Nick

Thanks for the info. Now, this might be a stupid question, but can I
download ST files and copy them to disk using my PC?
That is, will disks formatted on a PC run on an ST?
This is the first time I have had anything to do with an ST though back
in 1985 my first computer was an 800XL.
Thanks again
Nick W.

Yes, disks formatted for 720K on the PC can be read by your ST if it has a double-sided floppy drive. The standard disk formatting done by an ST however is not quite compatible with the PC and cannot be read by the PC. So do the formatting on the PC side. Another thing to keep in mind if you are going to transfer files FROM THE ST TO THE PC is that ST floppy drives have trouble writing to the newer High Density (HD) 3-1/2" floppies (the ones normally formatted to 1.44MB). So if you are going to move files in that direction, format some Double-Density (720K) diskettes on the PC for that purpose.

1) I have 3 files in the same directory all called \TEMP\, created I suspect when I tried to download files from CAB, forgetting to give them a name (the filename field gets blanked when you change directory in the file selector!) Any attempt to access them (copy,move,rename,delete,show) causes an error. Is there any way to get rid of them? I thought of moving all files except those ones to another partition, then reformatting that one partition. But there doesn't seem to be a way of doing it (I have HDDRIVER).

2) I have a folder containing 2 files with filenames > 8 characters, created when I unzipped a file extracted from a mail. I can't get into the directory - double-clicking from the desktop causes the window to "expand" but doesn't actually open, and attempting the open the directory from a file selector causes an error. Is there any way of getting rid of this directory?

Hi Chris,-

Well,- I`m not an expert in this matter, but I have had almost the same experience a couple of times. The only solution,- to my knowledge, is trying to save what ever you can from that partition, - then zero the partition, and install everything again.

I belive the FAT got corupted or something. I ended up with a Directory that had millions of bytes, funny file names etc.

cheers

Joergen

Your idea will work, except you don't reformat the partition. Look for
an option in hddriver that says "zero partition". This removes all the
directory/file entries and clears the FAT entries - the result is the
loss of *all* data on that partition. You then restore all the rest of
the contents which you backed up to a folder on another partition.

>2) I have a folder containing 2 files with filenames > 8 characters,

I don't quite understand how an 8+3 filesystem can give this problem
so I'll leave it to someone else. It sounds like a recursive or
otherwise badly linked directory entry. These can be the result of
exceeding the "40 folder" limit. It might pay to investigate its
current setting as it might be responsible for (1) & (2).

Joergen and Guy - thanks for answering my query.
```

Zero Partition sounds like what I need, but I can't find it. Neither HARDPART nor HDCONF seem to have the option. I've looked on the original installation disk too but there is nothing over and above those two programs.

Am I missing a file, or haven't I been looking hard enough?

I don't think it's the 40 folder problem - I have the patch that fixes it and never had any problems. It only occurs with this directory.

I only noticed that the files contained in the ZIP file were > 8 chars (probably Win95 files) in the log when it extracted. But it was too late to stop it then!

If I can find Zero Partition, I'm sure that will fix it.

Hi Chris,
I've run into that scenario from time to time, usually with newsie or cab. When it happens, I run Diamond Edge, to optomize the partition. I usually shows some damaged sectors which it fixes, creating some

lost data files, then defrags the drive. If, once this is done, I go
back and delete the files that previously couldn't be deleted, it
will work okay. If, however, I try to write to these same files or
open them, then I will have to do the process all over again.

hope that makes some sense, and helps your situation.

Single click on the directory and delete it, or drag it to the trash.

Sorry, that produces Illegal Operation. Looks like I'll have to Zero
the Partition.

```

Try looking for 'initialise partition' in one of the menu's, this does the same
as 'zero partition'.

I have a selection of Atari ST titles for sale.

This List Updated 19/7/1998.

```
email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
    ds = double sided disks
    ss = single sided disks
    ?d = number of disks
   meg = one meg of memory or more needed
    ni = no instructions
    nb = no box
   NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

If you don't mind losing the contents of the folders you could use a disc sector editor to fix this.

Look for the entries and replace the first character of the folder name with hex. E5. This will indicate to the operating system that the folders have been deleted and the directory slots will be re-used.

I think I *am* missing a program. HARDPART allows the selection of device 0 or 1 (0 is my hard disk, 1 is my Syquest drive). If I select my hard disk, it comes up with a list of all my partitions. There is nothing that suggest you can select an individual partition for formatting, there are no menus, just buttons that say "Divide", "Split" etc. I don't want to press OK in case it reformats ALL partitions.

HDDRCONF likewise, there are no menus just a single dialogue box.

Sorry to be a nuisance! What program exactly is this Zero Partition available in?

PS. Nice to see another Welshie - I'm in Llanberis!

Theoretically, yes. Stick to the 720K format (assuming you have a double sided drive on the ST) and DD disks. Do not use long filenames or folders on the disk.

Cheers,
Nick

I have had the same problems. Try deleting the DESKTOP.INF file.
Also get the newest version of NEWSIE, CAB and CAB.OVL. When you save
any files within CAB, make sure that the direcory line can be edited.
If it can't, then close CAB and reboot.

It's on the Atari, it's great! For price performance you can't beat it. Esp on a ST where you can't fully take advantage of it's speed anyway. RATEHD.PRG show a 13ms and 1100 transfer. That about maxes out the ST harddrive port. On the F030 it seems a bit slower, but I think that because of AHDI. I used ICD's on the ST. My computer would be useless without it.

I'm planning on adding a few new sections the Quick FAQ, but I'm no expert in these subjects. I'd like links and information about the following stuff:

- Printer drivers (GDOS or Not).
- LAN networking (especially using the Falcon/TT Lan port).
- Any other topic that might be missing from the Quick FAQ.

Cheers,
Nick

I currently have an unexpanded Mega ST4 (apart from a high density floppy and external hard drive) which I have just loaned to a friend who runs a studio. Unfortunatley, the acoustic noise produced by the cooling fan is unacceptable, so at the present moment I have disconnected it totally. Is this safe, or should I sort out some form of thermostat arrangement (if so, any suggestions?)

Thanks
Dave

I have installed a high density floppy drive in my Mega ST4 and built the approriate circuit to switch the floppy controoler to 16MHz when accessing a HD floppy. However, this means that the step rate has to be reduced to 6ms. At the moment I have to do this manually. Is there an auto folder program to do this for me available on the net?

Thanks
Dave

Then follow it up by using something like CORRECT.PRG or OPTIMISE.PRG to
sort out any logical errors. The one I think is the better of the two is
OPTIMISE.PRG as it doesn't remove LFNs, whereas CORRECT.PRG does.

I've version 2.03 (1 may 1988).

I've used this database for years and it always did his job very well.
Although an old prg it still works on the Hades 060 which can't be said of
some other old prg's.
Nowadays I use Phoenix.

It's a commercial prg so you won't find it on the Net.

I stuck a variable resistor in my MegaSTE so that I could slow the fan down...makes it a bit quieter.

If you install a thermostat you've still got the problem of noise when the unit heats up and the fan kicks in...it'll probably happen just when there's a break in the music...

From my informal observation, most of the heat seems to be generated from the internal hard drive. If you don't have one, then maybe you don't need the fan.

I would go for a complete port of the OS with processor emulation for
legacy programs.

This upsets me. The Amiga kernel is central to its efficiency and
general behaviour. Using another kernel will make it somwething else
than an AmigaOS.

>> be done under Linux. It will not include a Motorola CPU, it's probably

We don't know that. In fact, we don't know anything at all.

I'm uncertain, they've stated that they bought Amiga for its
community, and they have previously moved bought user groups to the PC
platform.

>> Basicly it's a completely new computer and OS with the Amiga name on it.

I'd say it's neither or a little of both.

>I can't see a PC being 5-10X faster then the current PII by end 1999.

If the Amiga can, why not the PC? And how do you know this isn't
vapourware?

>Besides, what the hell is the problem with having another alternative to
>Intel ?.

I welcome all alternatives, but I want to keep the Amiga alive, and
I'm not sure that Gateway are planning to produce an Amiga.

If you upgrade to TOS 2.06, you will get, among other benefits, a
default step rate of 6ms.

Bootsie will write a step rate switcher program onto the boot sector of
your floppies, but this is not ideal, as it won't work with games.

I've tried looking for an Auto folder program to do that, but didn't
find one.

Cheers,
Nick

I don't recommend running the Mega without cooling, but why not just
replace the fan? I replaced mine with a cheap CPU-fan, it's not as
noisy as the original and keeps the Mega cool.

I've got it. But I don't think it's public domain, and to be honest I haven't seen anywhere that sells it now. Try your "local" Atari dealer.

Hi,

I'm looking for the Astrology program that came from Antic about 10 years ago. Any leads on finding that kind of software, either for D/L or purchase?

Thanks,
Craig Morehouse

Try www.aix.com. If that's not right, ask Nima at Homa House (you can find that using metacrawler.com).

Good luck.

Hi All,

I have recently installed KGMD on my Hades and Falcon and they are both linked together via a serial cable. By using the slattach utility I am able to create a CSLIP link between the two. The problem I am having is that if I telnet from one machine to another after about two minutes the telnet session locks up and I have to do a Ctrl+Y to suspend telnet and get back to the command line. I don't seem to have this problem with FTP or NFS so does anybody know why this may be happening?

Any help would be appreciated.

Regards,

Ben Hills.

Hi,-
Is it me or something I`ve done wrong.

After installation of NVDI 5, I can`t print from within CAB 2.7.

The menu just shows the printerdriver as beeing METAFILE.GEM.

There was no problem before NVDI 5,- what is it now?

I have done everything in the book, still the same driver.

The PINPRN2.SYS is in the assign.sys file as driver 21.
In the NVDI.INF file the default driver is = 21

????
cheers

Usually, all modems look the same from the Falcon. As long as it plugs into the Falcon's serial port, there should be no problem.

Cheers,
Nick

I can't give you an answer. I only want to say that I've problems too.
Sure I can print B&W 300/600 dpi (HP laserjet 4p) but the pictures are
really very bad.
If I try to print greyscales I always get a message saying that drive j:
hasn't enough place. Strange because drive J: has 219.725 bytes free.
I'm using wdialog 2.01/NVDI 5

Does anyone have any hacks or mods for making the Falcon's serial port run at
115,200 instead of the 153,600 ? I use both CAB and Stalker, and Stalker lists
these non standard speeds as available, but my Zoom 56K modem want's to see
115,200 or other standards. I email'd Gribnif (stalker publisher) about this,
and the reply was there was a hack for this in HSmodem docs. I looked in HS
modem 7 docs, and could not find anything about this. Maybe it was in an
earlier version, dunno. I am also interested in adding the MFP hack to my
falcon, and would like to get some docs on that too. Maybe the LAN port would
be the way to go, but here again, I have not found any docs yet ! All help
would be appreciated ! Thanks....... Dan Valega

i tried to connect my SCSI ICD Link adapter to the megafile
HD "through" jack.
the 2nd HD on the link adapter is ignored ...
can i configure the megafile that way i can run both HDs on
the STE ???

It shouldn't be needed for games anyway. Most of them are supplied on DD
floppies so the default of 3ms is fine for them. The trouble will occur
when you do get an autobooting game on HD floppies.

There is. I added such a function to a clock-setter I'd written as, when I added a HD floppy module, I needed the same function. You can get it from:

<URL:http://www.my-ste.demon.co.uk/download.htm>

for this and a few other programs, or you can get it directly with:

<URL:http://www.my-ste.demon.co.uk/files/hdclock.lzh>

You can run it from the auto-folder or desktop. When used in an auto-folder, it will ask for the time, only if it hasn't already been set, and set the step-rate to 6ms. Subsequent reboots will take the time from the keyboard clock (as it keeps it through resets) and reset the step-rate again. If it's started from desktop, the same happens, except it isn't done automatically.

Good advice. If it doesn't help, it is probably the (only) custom PAL
chip
on the Megafile 60's controller board. If you can't find it in your

```
country
send me a mail and order one from me.

Martin

so this should be interesting.
>
> I'd love a DEC Alpha machine -- all I need is to see NT have better game support, along with hardware support for > Voodoo2. Maybe a Matrox MGA-G200? :>

They used Photorealistic RenderMan from Pixar. This is a quite expensive aplication, only used for rendering. The RIB data (RenderMan Interface Bytestream) was generated by an export function of 3D-Software Softimage.

A even better renderer is freely available for Linux, the Blue Moon Rendering Tools (BMRT) of Larry Gritz. This software is a combination of a raytracing and radiosity renderer.

As 3D modeling tools you can use Amapi 2.11, SCED, Leo3D or AC3D. For correctly moving physical bodies you could use Xaero.

And ofcourse you have good old POV ray, whici can be a very fast renderer when you are yousing a Beowulf configuration.

I am quite sure this list wasn't complete.
So there are some 3D tools available for Linux.

(No I am not a 3D software specialist. I am just a reader of the excelent German magazin C't (Computer Technik), they have a very good coverage of Linux items.)

Those annoying wires are finally gone with no loss of control or performance. Players who want the ultimate in freedom and control will love this in lieu of their standard 'joystick' for playing games. I have two 'Freedom Sticks' new in box...never used. Just recently retired from the military and downsizing my 'toy' inventory. These freedom sticks are compatible with Atari 2600, 7800 and XE and Commodore 64, C64 and C128. Operates at maximum efficiency up to 18' away from infrared receiver. Play 1 and 2 player games plus 2 player simultaneous games (requires 2 Freedom Stick units). 8 direction precision micro action puts you in control. You can have both of these units for $35 plus shipping. Again, these two units are brand new in original containers.

On Mon 06-07-98 11:04, David.DeRidder scribbled:

> Halt ! I think we're talking about different subjects here. I assume you refer to inside RPM and outer side RPM. That indeed differs. But what I want to know is : does the speed factor refer to the _internal_data_rate_ (!= inside RPM), that is the speed the laser picks up data from the disc, measured in K/sec, or to the external data rate, that is, the speed at which data is transferred from CD-player to host/computer ?

Actually, I _wasn't_ referring to RPM. According to the discussion on ZDTV, the data is actually read faster on the inner part of the disc. And the speed factor refers to the speed of the data being read from the disc, again, according to the discussion I saw.

But why would the data rate be different for reading from disc as opposed to transferring to host? Are you referring to a bottleneck at the connection? If so, I would think that would vary from computer to computer, so it couldn't be given a set measurement.

Hi there,

My diskdrive has developed a problem. It will read data off of a disk, but it occasionally refuses to write data, telling me that the disk is write protected. Is there some advice I could get before I start tearing the machine apart?

Thanks
Mike.

Terry May (outrider@lvdi.net) scribbled:

: But why would the data rate be different for reading from disc as
: opposed to transferring to host? Are you referring to a bottleneck
: at the connection? If so, I would think that would vary from
: computer to computer, so it couldn't be given a set measurement.

In several bus architectures, like EIDE or ATA, commands and data go on the same bus. I do not know how it is handled in a CD-ROM player, but on a harddisk, the device can read data whilst receiving a new command. So, in [long] sequential reads, the buffer fills up while the bus is idle because the host is sending a command.

Despite the higher rate on the bus, the internal buffer may fill up and eventually overflow (causing the so-called 'slipped-revs', i.e. the head has to let a track pass by because the buffer is full) . A faster external data rate solves this problem (a larger buffer size would shift the problem).

I do know the physical concept of a CD-ROM is different from that of a harddisc, so that is why I am confused.

But to rephrase your explanation : the speed factor refers to the maximal internal data rate ? So a 32x would be able to read data from a disc at 32 * 150K/sec = 4.7 M/sec ?

Thanks,

I'm sure someone has already done this but I'm looking for a way to connect my Atari ST to my Ethernet LAN. Any suggestions?

> But to rephrase your explanation : the speed factor refers to the maximal
> internal data rate ? So a 32x would be able to read data from a disc
> at 32 * 150K/sec = 4.7 M/sec ?

Because all of my information came from a discussion on TV that was done, at least in part, to help hype a new type of CD-ROM with seven lasers, I don't think I should speculate beyond what I've already said. I'm far from an expert and was just recounting what I had seen on ZDTV.

For all I know, the guy was full of crap. But he DID say that the X factor refers to the maximum read rate of the drive, and that the maximum only occurs at the inner half of the disc (except, of course, in the case of the drives he was hawking).

Sorry, but beyond that your guess is as good as mine (maybe better ;).

The latter.

The device-to-host speed usually is much higher than the effective physical
read rate. Even an old double speed CD ROM will return the data much faster
than 300K/s when it's already in the cache.

However: the newer CD drives only reach their maximum read speed on certain
parts of the CD medium, and only if there are no errors on the CD. Therefore
it's quite possible that a 32x drive will not read faster than with 12x
speed.

On the Atari, there are obviously some other reasons for reduced speed
(SCSI/ACSI DMA limits, or the fact that data from IDE CDROMs needs to
be swapped by the driver).

Check out the benchmarks on my home page, they will give you some real
world numbers (http://www.muenster.de/~reschke/cdbench.html).

Why
>buy something worst, heh? Obviously, they want to copy it.

AFAIK Alpha processors are manufactured by Digital which is now owned by
Compaq and they're the one who own the technology. Judging from your
conversation Intel have bought or licenced Alpha technology, is this true?
If that's the case, where can I find more information about this since I
have obviously missed something.

But this copy part is ridiculous, Intel needs the latest in technology just
because of their efforts to keep the old structure and concept they used in
the Intel x86 processors. A concept dating back more than Intel CPU's and
that was great ... back in the 80's in the first Z80 home computers. Today
Alpha and PowerPC processors are way ahead if you compare the ratio between
technology used and performance given. Intel has often used better
technology if you look at plain electronics involved. Still they get
outperformed by relatively simple and cheap RISC processors.

>Does it matter that a boot drive is Atari formatted or pc DOS formatted.

The problem is that Ataris and PC's use different code in the bootblock, so if you want the drive MS-DOS compatible you probably have to use a floppy with HD drivers and MS-DOS compability programs on. But you know that by experience already, don't you :)

The better solution in my opinion is to have an Atari partition and boot from that. Then you can have the rest of the disk in whatever formats that are supported by your drivers.

You should also be aware of that there are problems with partition larger than 32Mb since this is the largest "legal" MS-DOS size for partitions. After that you must have some driver for reading large MS-DOS partitions like BigDOS or MagiC 5.xx.

>I appreciate everyone's input.

The Guru on the subject is Uwe Seimet, the author of "HD Driver" which is the best driver IMHO, but I can see that you've gotten in touch with him already.

And for me too.

 m> It accepts up to 2x 72 pin SIMMs to make a total of up to 64MB of TT
 m> RAM.

More specifically, it has two slots for 72-pin non-EDO SIMMs.  Either one or
both slots can be filled with 4, 8, 16 or 32Mb SIMMs.  The SIMMs don't have
to be matched by size (32+4Mb is possible if you like).

Very flexible and uses the current cheapest SIMMs.

No, I'm afraid there isn't. There is a very rare LAN card for the Mega STE and TT, but nothing for the ST.

There are other means of networking an ST though, through the serial or parallel ports, with STinG or MiNT...

Cheers,
Nick

I've got a Migraph hand scanner for the ST, but the power supply is long gone. Does anyone know what voltage it runs on?
It is a mono scanner, Migraph B5N-17, made in Japan in 1990. I have the manual, but it doesn't help.
Thank you in advance,
David Boston

Charlie Wood wrote:

> Does it matter that a boot drive is Atari formatted or pc DOS formatted.

Yes, it does. Usually you can't boot from DOS formatted drives. It might
be possible to boot from drives that have been partitioned TOS and DOS
compatible at the same time with HDDRUTIL but I've never checked this.

> that I can't use the 500mb drive as a boot drive. I also tried this

The boot partition must not be larger as the maximum partition size your
version of TOS supports, of course. But if the partition size is OK you
should be able to boot from this drive as long as the partition is a TOS
compatible one.

> my scsi zip attached to the ICD box and got the same thing.

So it might be a problem with your driver software. You could start a
try with the demo version of HDDRIVER:
http://acp5.chemie.uni-kl.de/seimet/atari_english.html

I've actually tried the Pioneer and Ricoh on my Falcon now and the Pioneer works straight off no problems at all. Unfortunately the Ricoh doesn't so still looking for a driver for that.

Hi. I require the external DMA to internal DMA(20 pin header) Supra cable.
There is a choke on the internal end of the cable, which slides into a
groove at the back of the shoebox case.

Perhaps you have a Supra shoebox case with a dead Supra Controller and
wish to sell the above cable.

Alternately, I need to know where I can get a DB19 male end in case I need
to make the cable instead.
Thanks.

I just purchased two Cyber Drives (24X SCSI, Hi-VAL) that work fine with Extendos. They sure make a lot of clatter and jump about quite a bit.

Does anybody know what to do to fix an Atari Stacy Keyboard with
non-working keys?

Is it possible to take apart the keyboard and re-seat the mylar
membrane, or perhaps clean it? Or do I have to buy a new one

The same Riebl card also exists for MEGA-ST bus.

Drivers for these exist in:

- NetBSD/Atari
- MiNTnet (requires a 030 machine)
- STinG

More recent cards based on the Lance chip should also work with
these drivers. I'm currently investigating this and will report
through the TT Homepage's networking section.

I trying to install a Quantum ProDrive LPS connected via a LINK type cable
on my STFM 1 Meg.

The problem seems to be terminator related as when I boot with that drive
only , it isn't seen by TOS. If I run AHDI or similar from GEM it sees a
drive but the name of device on SCSI 0 is all mangled up.

Is the normal for this type of drive ?
As all the other SCSII drives I have used are fine , and seem not need
terminating.
I was told that it came out a of MAC system , could it be a special one for
that system?

No, definitely not, we got about 95kb/s with a plain mega-st4
a 030 is not necessary.

Not quite right:
With a bigger logical sector size you can access partitions up to 256MB on
TOS 1.00 and 1.02.

In general, it behaves like this:

```
TOS 1.00, 1.02:        256MB max.
TOS 1.04 up to 3.06:   512MB max.
TOS 4.0x:             1024MB max.

Access via BigDOS or MagiC: 1024MB max. TOS compatible,
                            2048MB max. DOS compatible
                                        (requires HDDRIVER>=7.0)
```

Hi!

[Posted and mailed]

In article <6npqg5$b9g$1@nnrp1.dejanews.com>,
ben@imperial.co.uk (Ben Hills) writes:
> I have
> been trying to boot from floppy disk by holding down the Alt key at boot

> up as this works on a Falcon.

If the harddisk driver is corrupted (which it seems to be in your case), holding down Alt won't help you as this is already an option of the driver, not TOS. That means, it's not TOS which allows you to prevent booting from HD, but the driver.

In that case, either switch off the HD which causes the trouble (if it's an external one) or use a disk with a special bootsector that skips booting from HD. I could send you a program to create such a disk, if you still have access to another Atari.

Ciao

Thomas

Does your Link handle parity ? If it's a Link2 it should, but if not,
maybe you have to disable the parity jumper on the drive.

Cheers,
Nick

As a TT user, I recommend this:
Switch off; remove the floppy disk, switch on and wait - and wait-
and wait: press a key and wait again. You wil see a TT Low screen
with an A and B icon.
Now insert your boot disk and start from the beginning, as described
in the manual.

Subject: Scancodes for extra keys
Date: 1998/07/10
Message-ID: <GWKZCXG@tos.pl.net>#1/1
X-Deja-AN: 370063029
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.st.tech,comp.sys.atari.programmer

Are there any scancodes defined for the extra keys present on some keyboards (I am looking at a AT keyboard), for example the F11 and F12 keys, End, Page up, Page down, Scroll lock, Num lock, Print Screen and Pause. Also some newer keyboards have a few extra keys as well, such as the "Windows" key.

If there are not any scancodes assigned to these keys, how should they be handled on such a keyboard? What should keys like Scroll lock and Num lock do? What does Scroll lock do on a normal IBM compatible?

With Num lock I could make it simply return number keys when on or arrow/alternative keys when off on the number pad, is this the correct behaviour, or will this be handled by TOS if I make Num lock send the correct scancode? If the latter, how should I know when to turn the num lock light on the keyboard on and off?

As for caps lock, the computer can at any time change the state of the caps lock without telling the keyboard, I believe, so is there any way I can know what state the caps lock light should be in (on or off) at any time?

(I'm talking from the point of view of the keyboard.)

Thank you for any hints.

```

Oups!

Only NetBSD/Atari requires a 030,

    MiNTnet works on any Atari.

I somehow inverted the info on these 2 lines.

The Stacy has a mylar to the MEGA-STE and TT (different part # though).
Once broken, you need a replacement. Best Electronics sells their own
replacement, which uses a thicker mylar substrate that is more robust.

This may not be the right NG, but I have repeatedly tried to use Dust, the ST disk utility for mac by Marcus Phillips, to convert my old ST files to .ST format for use in emulators, and vice versa. So far I haven't had any success. The disk images produced (.ST or .MSA) are "not valid" according to the emulator, reading from a disk will produce the result zero, and writing to a disk will not work at all.

Has anybody else found Dust useful for anything? I'm using version 1.0.2 of Dust and Mac OS 8.1

This looks like a clear case of a non-terminated chain. See the bit below.

> >

```
> > Is the normal for this type of drive ?
> > As all the other SCSII drives I have used are fine , and seem not need
                                                            ^^^^^^^^^^^^^^^^^
> > terminating.
    ^^^^^^^^^^^^
And there's the bit that says he hasn't terminated _any_ of the drives he's
used.

> > I was told that it came out a of MAC system , could it be a special one for
> > that system?
>
> Does your Link handle parity ? If it's a Link2 it should, but if not,
> maybe you have to disable the parity jumper on the drive.

I don't know if it's a problem with the parity. The first thing that should
be done is to put some terminator after the LPS and see if it still has
problems. If it does, it could be parity that is causing _some_ problems,
but lack of termination is probably a major contributor.

Just in case you don't have the jumper pin-outs (couldn't think what else
to call it) here they are for the LPS drives I have the info on..

With TOS 2.0x it's 512 MByte per partition.

> TOS 1.2 is 16Mb

This is wrong and has always been wrong. With TOS 1.02 the maximum
partition size is 256 MByte.

```

|keys, End, Page up, Page down, Scroll lock, Num lock, Print Screen and
|Pause. Also some newer keyboards have a few extra keys as well, such as
|the "Windows" key.
| . . .

I am using an IBM keyboard with my DirecT60. It mostly works OK but with a translation program in the AUTO folder. F11 and F12 are opening and closing brackets. Home is where the heart is. End does nothing. Page up and down work as expected. Scroll lock in Everest jumps down four lines. Num lock when on gives numbers from the keypad and when off gives cursor movements. Pause is the Atari Undo key. Insert in Everest toggles between Insert and Overwrite modes. Print Screen is the Atari Help key.

As far as I know I could not use this keyboard directly with my standard STs (not plug compatible for a start). I know that there is an interface available. The Atari keyboard has a microprocessor inside which translates the keypresses into scan codes. I am uncertain how the PC keyboards communicate with PCs.

| . . .
|As for caps lock, the computer can at any time change the state of the
|caps lock without telling the keyboard, I believe, so is there any way I
|can know what state the caps lock light should be in (on or off) at any
|time?

I remember in the old ST World, a reader wondered whether it was possible to get the machine to emit a different beep when typing with Caps lock on. This would be invaluable for non-touch typers such as myself who glance at the screen now and again only to find THE LAST LINE ALL IN CAPS.

> THanks.:)

You will definitely need at least one floppy drive. As far as I know,
the ST
requires a special serial port driver to be able to use a PC serial
mouse.
I don't know the names of such drivers but somebody here surely does.
Such a driver would have to be placed in the AUTO folder of your boot
disk.
You will have a problem building such a boot disk yourself without an
ST-compatible mouse.

Those are my thoughts.

I have some 1 meg SIMM's ideal for upgrading your STE or Extra RAM Deluxe upgrade board.

```
Upgrading from 512k or 1024k/1 meg to 2 meg .... 10.00 UKp (Sterling)
Upgrading from 2 meg to 4 meg ................. 10.00 UKp (Sterling)
Upgrading from 512k or 1024K/1 meg to 4 meg .... 17.50 UKp (Sterling)
```

Along with the memory, you will get fitting instructions and a disk of utilities.

Sorry, UK and Europe ONLY unless you cover extra costs.

Cheers! for now
               Steve

Is termination switched on??.

U> Is the normal for this type of drive ?

My LPS works fine.

U> As all the other SCSII drives I have used are fine , and seem not need
U> terminating.

Er!!, they should all be terminated if they are the only or end of a chain device.

I have had severe problems with getting other SCSI devices working with my MiniS hard drive with a Quantum LS mechanism. I could not get the drive working with ANY device at all, and it wasn't restricted to that mechanism I tried another LPS drive with the same effect.

The garbled message sounds familiar, I swapped my mechanism just to illiminate the hard drive; now I have no problem at all. So I won't be wanting another Quantum LPS drive again.

If you have more than one drive then this could be the problem; at last I can use a CD-ROM drive.

If you can beg, steal or borrow (assuming you are using it with another SCSI device) another hard drive with a different type/mechanism.

I hope this helps, as I know how frustrating it feels:)
Cheers! for now
Steve

The Syqyest EZFlyer (230M) is now cheap enough for me to consider.

Can I run it directly from my Falcon with AHDI (6.?), or do I need to
get HD Driver?

It should run. I've an Iomega Zip and have no problem with ahdi.

If anyone's interested in picking up the Abacus Software series of
books on the Atari ST, I've put a couple up on the ebay auction site.

If there's enough interest I'll post more of the series, as well as
some 68000 assembly language books.

Newsgroups: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all,

I've been getting familiar with SozobonX (v2.05) on my TT/030 and I'm getting wierd behaviour with the fwrite() function. For example:

```
#include <stdio.h>
#include <stdlib.h>
#include <fcntl.h>

char test[32] = "Some test data";
FILE *outfile;

int main(int argc, char *argv[])
{

  outfile = fopen("foo.dat", "w");
  fwrite(test, 32, 1, outfile);
  fclose(outfile);
}
```

(error checking etc. omitted for simplicity)

Now if I look at the data actually written out, it's not at all what it should be.
I'm reasonably proficient in C, but am I missing something here or is it a known problem (buggy lib etc.)

Thanks in advance,
-Russ Magee

I don't know if it's running with that old ahdi
But it works fine with hddriver.

Regards, Robert

Could anybody with one of these accelerators tell me where the wire for the switch goes on the T25 board as mine has fallen off and I don't know where to reattach it to. This means I am running in 8mhz mode all the time which is a real bummer.

Thanks for any help

hi just for you John i disabled hd driver,installed ahdi and booted
my falcon with my ezflyer attached yes it works ok,but does not identify
itself and did not like i big partition

in fact with hd driver, empty or with a i35 cartridge in it is a syquest
with a 230 cartridge in it is an atari megafile???? strange
but never the less it works fine

I fully realize that I may be asking a foolish question, maybe
even a faq, but my naivete WRT Atari ST is fairly profound
although I once had a 520 long, long ago (if I'm ignorant now,
what must I have been then?... Don't answer that!).

O.K., so Frederic Gidouin has created this nice hardware-level
emu (it looks... uhm, well, real). He's also put in the ability
to configure enhanced resolutions and I've had SDD on my PC for

a long time, now (very handy). So if I set the render mode to "line" and the vbemode to 0x100 (for 640x400x256), for example, you can that much works when that Atari Fuji logo comes up and the memory test starts, however, the TOS desktop is uninterested in the current display resolution. Your choices are still low res, which uses the upper left quadrant, or med res, which does seem to take up the whole screen, but looks just like it always does with only 200 lines.

Anyone got helpful advice or pointers?

Thanks,
Larry

HI all,

I am after people to interview for MEGA issue 3, If you run a softwhere house, PD libary or similer then I would like to do a quick interview with you. makes good free addvertising as well.

If you know any good links to interviews such as the crew in Star Trek then I would like to use them.

Anyone who helps I will of course add you to the credits in issue 3. Thats if you give me your name that is ;-)

Anyone one know of a good Word processor for my Falcon ? ? ?

I am currently using 1ST word which is ok but not really powerful enough.

Thanks.

chris.swinson@zetnet.co.uk

By the way, sorry to the good people in the world, but I don't want
any junk mail IE sunglasses, bibles, sex videos, or anything outside
the UK in fact.

I only just changed server and I am getting jumk mail already, ok its
my fault for putting my mail address in news groups, but I anin't
interested OK .

1ST Word really is not good at all. A simple text editor like QED would be far better than 1ST Word. However for a really good word processor, you will want to try Papyrus. Or if you need a spreadsheet and database as

well, AtariWorks is a good all round package although it's not as good as
the WP, SS and DB products available separately.

No floppy drive? Original 520's in the US all
included an external SF 354 (Single Sided
Double Density) floppy drive with connector
cables and external power supply. As an upgrade
you could specify an external SF 314 (Double Sided
Double Density) drive. Check the Atari dealers
to see if you can get an SF 314 WITH power supply
from them.

Although the OS is built-in to the ROMs, you'll
need one floppy to load any application software.
Ataris are the last of the computers able to run
serious software without a hard drive, but you'll
probably want to connect one to that 19-pin dSub
connector on the back. For that you'll need a
"host adapter" ($100.00) and a SCSI drive. The best
hint: buy the host adapter, read the manual, then
buy your drive & drive enclosure/power supply.

Unlike computers based on the IBM-PC, Atari computers
were designed with built-in mouse support. It plugs
into the "joystick 0" port, leaving your serial port
free for ... um ... well, serial communications.

The GEM operating system really delivers on the promise
that computers should be easy to use. Unfortunately,

people are so accustomed to complex, indecipherable
alternatives that they EXPECT computers to be difficult
to use. Once you get up and runnin' you'll find that
you spend more time working WITH your computer than
you spend working ON your computer.

And that's good.

-- George Crissman

This is probably a bug in the EZ firmware. The drive doesn't seem to identify itself correctly (i. e. according to the SCSI specs) if a cartridge is inserted.

: [...]
:   fwrite(test, 32, 1, outfile);
```

:   Now if I look at the data actually written out, it's not at all what
: it should be.

Hmm, that would indeed be strange for such small amounts of data...

:   I'm reasonably proficient in C, but am I missing something here or is
: it a known problem (buggy lib etc.)

The only thing I can think of is that with large amounts of data, you should keep in mind that Sozobon's "int"'s default to 16-bit, so you might not pass a full byte-count. Use -mlong when compiling the program and see if the

problem goes away...
Sozobon is a nice compiler, but it has its problems, especially when you try to use it to port stuff... (malloc with 16-bit parameters isn't a good idea if you ask me, also because lalloc() isn't very portable...)

Anyway, good luck...

AFAIK all halfway modern HDD drivers (AHDI >=3.0 standards) can handle

large partitions, so it only depends on the OS version.
Make sure your hard disk partioning program is quite new...

Hope it's clearer now,

Carsten

The one on my compendium CD is in an archive called mouse25.lzh (in the
directory umich/utils/mouse/, so you should be able to find it on UMICH)

> Such a driver would have to be placed in the AUTO folder of your boot
> disk.
> You will have a problem building such a boot disk yourself without an

Dont forget that the Atari allows you to move the mouse pointer via the keyboard. Hold down <ALT> and use the cursor keys. <ALT>-Insert is left click.

Anthony

Try terminating the string since it is less than the allocated amount with:
char test[32] = "Some test data\0"

Thats odd, my LPS is happy with a HP-DAT, a IBM CD-ROM, and my ZIP, all on the same chain.

[][][][][] SYSTEMS [][][][][]

*** MEGA STE ***

Item   : Mega Ste   TOS 3.06, 4mb RAM, 1.44mb internal floppy

Trust me, this Mega Ste is faster then stock

Comes w/ :

*SC1435 Stereo Monitor   *1 gig internal hard drive

*Migraph Hand Scanner   *Floppy drive disk cleaner

*Joystick

*Golden Image DS/DD Ext. Floppy

*Manual

*Language Disk

*STAR NX2410 printer w/box and Man.

*Golden Image mouse w/mouse pad

*Chaos Strikes Back w/manual

*450-500 disks w/ nice locking disk cases (ea. holds 90 disks)

*All Cables and power cords needed, including a power strip.

* If you want, I'll throw in 1.5 boxes of paper for the printer, but I'm sure it's not worth shipping, due to the weight.

Asking: $400 + shipping (willing to entertain offers)

And if you want anything in the 'Misc" section, I'll pry throw it in for FREE!!

*** 1040STf ***

Item   : 1040STf   TOS 1.00, 1mb RAM, 720K internal Floppy

Comes w/ :

* SC1224 Color Monitor w/manual
* Floppy drive disk cleaner
* Chaos Strikes Back
* Owners Manual
* Language & System Disk
* 2 Joystick Extenders
* Mouse w/pad
* External hard Drive setup. 90mb worth of space, on the Link host adapter. Autoboot with ICD. Comes in a beautiful case, with original ICD software.
* External CD-ROM w/manual. Model: NEC-25. Comes with Extendos (manual and original software included)

Asking: $180 + shipping (Willing to entertain offers)

And if you want anything in the 'Misc" sections, I'll pry throw it in for FREE!!

EDO works fine in my aixTT, atleast as long as I stick to 60ns SIMMs.

>Very flexible and uses the current cheapest SIMMs.

Non-EDO is usually a lot more expensive than EDO, so I suggest you try
EDO-SIMMs first.

Recently my last Atari mouse broke down and I bought two "Manhattan"
replacement mice. They are switchable for use with Amiga/Atari, but they
seem to live their own life at times, the pointer can rush across the screen
by itself when left unattended for a while (which seems rather cute, doesn't
it?), and sometimes it also jumps around a bit when using it (devastating
when you use a tracker ;) )
```

Anyway, I've borrowed a friends mouse (Amiga luser) which also was switchable, and it was even worse! You couldn't point at one thing for more than a millisecond if you wanted to click on it. What's the cause of this ghost movements? Any repairments/modifications suggested? I had a Naksha mouse several years ago which worked perfectly .... I still wonder why I sold it.

```

That won't make any difference because:
- String literals in C are already implicitly terminated by \0
- In any case, fwrite just writes a stream of bytes and string terminators are irrelevant.

What you probably need to do is pad out the string with spaces to its full length (*31* characters, remember the implicit terminator!), or take the real length into account in the call to fwrite, ie replace
```
    fwrite(test, 32, 1, outfile);
```
by
```
    fwrite(test, strlen(test), 1, outfile);
```

I got an EZ flyer a few months back at Compusa for $129.  Tried to
hook it up to an old Amiga, had nothing but problems.  This weekend I
reformatted it to use for backups.  Works great.  BTW the EZflyer230
is almost as fast as my Jazz drive.  On my Falcon.  You may want to
consider a JAZZ, or wait a bit because Syquest has a 4.7 gig removable
coming out soon.  Once that is available, the Jazz, and Syquests's 1.5
gig drives should come down to under $200.

B.P.

Whatever.  I have seen bizarre string requirements like I mentioned with
various flavors of C compilers on different operating systems.
     All were
quoted by the MFG as "ANSI C" compliant -- obviously which was not quite the
case.  I offered it as a suggestion only (I did say TRY it), not as a defacto
absolute fix.

It isn't necessary but it could well be another reason why it isn't
working. Staying with the same scheme as my other posting:

char test[32]  ="foo";

Compiler should behave like this:
Invent name for "foo", say L1
static char   L1[4]     ={'f','o','o','\0'};
memcpy(test,L1,4);

The bug might be that it is doing this:
memcpy(test,L1,32)

or just as bad:
test = L1;

Who knows! ;-)

I just got a 1040ST and 20MB supradrive, however it keeps resetting
itself just after boot, i dont have the utilitties disk for it and was
wondering if anyone can email it or tell me where to get it.
its version 2.2.
Thanks in advance.

Hi all!

Just thought I would drop by and see how the Atari world is doing!

I owned an Atari 400, 1200XL, 1040st and finally TT030!!!

What a great time I had!

Can anyone bring me up to date on the Atari world as far as any new machines, etc. I saw something about Milan and there being a TOS 5.x???

Also, anyone remember the company that produced NeoDesk? I think it was Gribnif or something? Did they ever reveal what the heck the name of the company meant???

Talk soon!
Anthony

>B.P.

There's also the Orb Drive that's due to be comming out now that should also help drive prices down. It's a 2.1 Gig removeable in a varity of formats (IDE, SCSI, Internal, External) which is suppost to be like the Syquest SparQ drive where the drives $199 and the cartrdiges are really cheap at like $40 for a 2.1 gig cartridge.

To be put out by a company called Castlewood which is founded by a few former Syquest employees.

I have a SparQ, but have been sadly disappointed in it, it's failed for the second time in less than 6 months I've owned it and back for replacement under warrenty. Will be selling it when I get it replaced. Speed wise it's great, but reliabiltity as you see leaves something to be desired. I have other Syquest Drives on my Mega that work fine, (2) EZ-135's and a EZ-230 Flyer with no problems which replaced a group of Syquest 44 meg drives. I like Syquest, but question there product life with 2 failures in less than 6 months. (It finally started shipping right after Christmas last year),   I had prepordered mine and got it about the 8th of Jan.

> any junk mail IE sunglasses, bibles, sex videos, or anything outside
> the UK in fact.

Those trying to stuff you with get-rich-quick plans and sex videos aren't good people. In fact they aren't people at all, just programs that skim the Usenet for addresses to harrass. You can get rid of them by "scrambling" your emailaddress. Just put something obviously out of place in it and your address won't be valid any more. See here:

chris.swinson@REMOVE_ME_TO_REPLYzetnet.co.uk

A real person will understand (or be informed) that the address needs rectifying, but a skim-program will not. You could also add a signature to your postings which says something like:

"Remove REMOVE_ME_TO_REPLAY from my email address to reply."

You could also get an alias on say http://www.bigfoot.com which will act as a mask or front to your ordinary address. Bigfoot redirects everything it gets to you. When you grow weary of junkmail you simply kill off your Bigfoot account and get another one.

In fact, it's probably a good practice to have several alternative addresses. Only problem is that they're more difficult to get rid of than to get hold of! Hotmail require that you send them the exact information you typed in when you signed up for the account.

I always write my entries down on paper.

A tip is to state as little income as possible, and as few "interests" as possible. Think that you should click on the youngest agegroup as well. All to make you as unattractive as possible for junkmail and other "offers".

Cheers, Martin

The Milan is another TOS clone, built in Germany based on a 040 processor. There will be an 060 later on. It uses a special TOS (4.5) and a combination of MiNT and N.AES called MilanOS.

You shouldn't need one, except if you have one of the very first
1040ST's that didn't have TOS in ROM, in which case, you should rather
look for ROMs instead of a boot disk.

Try leavin the computer on for a few minutes without a disk in the
drive. The desktop should come up by itself. Then format a DD disk using
the desktop option. Booting with a correctly formatted disk in the drive
is instantaneous.

This is all in the Quick FAQ...

Cheers,
Nick

If you mean the language disk (the only disk ever shipped with the 1040s):
forget it. There is only trash on it...

> You shouldn't need one, except if you have one of the very first

There have never been any 1040ST computers without TOS in ROM.

So long,
Carsten

Does the SparQ come in SCSI, or just IDE? Can you use ez135's in a ez230. I hope I don't have problem with my EZ230. They've been around for a while so I guess they have manufacturing worked out.

I have always avoided first production runs of any product, especially from small companies. There are always production bugs to ghet worked out.

I have a Jazz, that I have had for over a year. Not one problem. I can't wait for prices to come down on the carts though. More competition in this area will give us better products alot cheaper.

B.P.

Greetings Fellow Atari Users,

I have an �ATARI 1040st� which I use for music note printing and word processing. I have circa 1.5 ram meg and no hard disk.

I would like to connect this Atari 1040st to a new �OKI 4m� LED(laser) printer which has ports for both PC and Macintosh computers.
Can this be done?
How do I do this; please be specific.

(At the moment I am using an �OLIVETTI JP150W� bubble jet printer and it is very slow and the lines are sometimes not sharp.)

Please answer as soon as possible.
Mega Thanks.

Respectfully,
newyork999@hotmail.com

Hi,

I've got a second hand Magnum board for my Falcon.

I would like to know were is the new RAM. There is a small text on the disk about the cookie (MAGN) and I'm looking for a GFA source to use these infos:

Wenn die MAGNUM-Karte das FastRAM installiert hat, wird der Cookie
"MAGN" angelegt. Dieser zeigt auf folgende Struktur:

```
struct
{
     unsigned int version;   /* Versionsnummer - momentan 1 */
     unsigned long fr_start; /* Startadresse FastRAM */
     unsigned long fr_len;   /* L�nge FastRAM */
} MAGN_cookie;
---------
```

The driver is v1.6, according to the message at boot up. Is there a newer one and where to find it?

Bye,
/Pascal/

The SparQ according to Syquest is only going to be producted as an internal EIDE drive or a Parallell port connection. Yes, you can use the cartridges from a EZ-135 in the EZ-230 drives. Note: The connection on the EZ-230's is a standard 25 pin connection, so you can't just hook it up via a ICD Link or whatever adaptor you have.
I daisy chain my SLM-605 into the EZ-135 via ICD Link II into the EZ-230 then into my external NEC 3X CD-ROM.

The first EZ-230 I got on sale for $99 I sent back because I couldn't
get it to work by formating either the EZ-135 or 230 meg cartrdiges.
It would read the EZ-135's I already had.

Are you using the Jazz on an Atari or PC?? How do you like it?

Your right, the media price does need to drop, yet, if people are
paying it, they won't lower it..
Why should they until to keep the market share they have to.

Hi David,

  I haven't looked at them in years, but I still have my MegaFile
cables if they would be suitable in the event you build your own. You
can have one of them for 50% of the postage from Bangor, Maine, USA.

Terry

I am getting an Atari 520ST fixed up for my grand-children and need to
know if I can use a standard PC mouse if I rewire the plug.
If so, does anyone know how the plug should be wired?
Any help would be greatly appreciated. Are there any commercial games
still available?
Thanks, Nick W.

Anthony ... welcome back ... lots has happened since the TOS platform supposedly 'died'. Some personal highlights from the current state of play ...

* numerous TOS clones, Hades, Medusa, Phoenix, Milan, C-Lab Falcons
* TOS emulation for PC, TOSBOX, Gemulator, Pacifist
* *STILL* lots of new software of high quality
* Music technology magazines 'The Mix' and 'Sound on Sound' *STILL* carry 2-3 pages every month devoted to Atari ST (that's nearly 15 years since their introduction)!!
* STe can now take IDE drives (TUS developments)
* 68020 based 16 and 24MHz accelerator card with TT fastram for STe (TUS dev again)
* Ataris happy with new generation of SCSI devices, ZIP drives etc
* TOS has an excellent web browser called CAB, supports frames and forms etc
* Hardware MOD to serial port available for modem speeds up to 128k
* New printed mag in the UK, 'Atari Computing'
* ST is *STILL* the computer of choice for the budget conscious MIDI musician
* New interface allows up to 14megs of memory on standard STFM (not STe yet)
* Thriving on-line community

Pretty lively for a 'dead' platform!

Viva Atari,
Jim.

No, it is not so easy. You can connect a PC mouse to the modem port (with
any 9-to-25-pin serial adaptor), but you need a driver program (eg
PCMOUSE.PRG, don't know where to get it).

So long,
Carsten

Yep, a good sign for a realy cheap plastic bullshit.

Daylight comes into the mice housing, that's the hole problem.

Paint the housing inside (only!) black..

(Dismount all before painting)

Regards, Robert

Could be several things. Start with the cable connecting the screen to the computer. Suck clear all solder joints and solder new ones. Atari (or Goldstar?) saved on solder and thus gave us joints of lesser durability. Continue with the rest of the solder joints. This sounds very tiresome, but is quicker than actually inspecting and serching for bad joints.

I draw a cross with a black pen which separates the circuit board into four "territories" and then I plow through it centimeter by centimeter.

If you're not experienced with TV:s and monitors you must be aware
of the risc of v-e-r-y dangerous electrical discharges inside your
SM124. Be careful!

Well that's what the previous owner told me ... I'll have to check that.

> (I use the MegTT board from System Solutions, with 16 Mbytes. The board

That's moderately interesting. (72-pin SIMMs are cheaper nowadays).

If you ask me this new computer doesn't realy sounds like a Amiga at all. It will only be compatible with old amiga apps through emulation. The OS will be completely new and based on a outside developed kernal like BeOS, or Mach. This you can already be done under Linux. It will not include a Motorola CPU, it's probably going to use intels comming Merced chip, or something else shitty. The "new" amiga which will be like a bridge to the new platform which will be released later this year will be based on the Pentium, so it's clear that they will go for the x86/intel line like everyone else. Don't forget that Gateway has only made intel boxes and never even seen a PPC.

Basicly it's a completely new computer and OS with the Amiga name on it. It's like buying a PC whith the Commodore sign on it. It has got nothing at all to do with

Commodore.

If you mean that you want to upgrade your RAM, I would recommend the Aixit AixTT RAM board which has worked very well for me. It accepts up to 2x 72 pin SIMMs to make a total of up to 64MB of TT RAM.

What about the Digital Alpha work stations?

That are real computers! After an 8 bit spectrum and a 16/32 bit
Atari it is time to scale up again. Not to a lousy 32bit system. That
was interesting 10 years ago. Nope, time to get 64 bit hardware, that
is progress!

The Alpha processor is for serveral years the fastest processor
available. The newest stuff if quite expensive. But if you go for
the outdated stuff you get a good price. Outdated are:
300-400MHz 21164 processors, they come typically with 96kB
2nd level cache and 1Mb 3rd level cache.
(My system, 300 MHz Alpha 21164, 1MB cache, 64MB RAM, SCSI CD ROM,
1GB SCSI harddisk, Matrox Millenium graphics card and ethernet
network was about NLG 2500 or about 1250 US$, half a year ago.)

Take as OS Linux and you have some real computing power on
your desk.

Bye, Hans

Hi can someone help

My falcon has an adapter board currently populated with
4mb of nondescript 72pin RAM, the board is not
unlike the falcram from titan, what ram can i use and should i
go for EDO? by the way i have a nemasis upgrade on it's way.

cheerz

Apple has been around for over 20 years. That's a long time for a
computer manufacturer. I don't think they'll be disappearing any time
soon.

I just got an atari 1040stf w/ sh204 harddrive at the THRIFT!
No mouse or cable for the HD though.
I paid all of $6 for this thing and I know it works (I already had a
SC1224).

Can anyone help me out?
please e-mail me directly at
tdevall@tiger.lsu.edu

Thanks, christian

It will
> only be compatible with old amiga apps through emulation. The OS will be
completely

Are you saying that if a new ST was released it would have to be 100%
backward compatable with the old eighties designed hardware ?.
Emulation is a great solution for backwards compatability.

> new and based on a outside developed kernal like BeOS, or Mach. This you
can already

The kernal will "borrow" parts from other OS's, a lot of the features of
workbench will be retained and enhanced further.

> be done under Linux. It will not include a Motorola CPU, it's probably
going to use
> intels comming Merced chip, or something else shitty. The "new" amiga
which will be

Definately not Merced or anything Intel.

> like a bridge to the new platform which will be released later this year
will be
> based

> on the Pentium, so it's clear that they will go for the x86/intel line
like everyone
> else. Don't forget that Gateway has only made intel boxes and never even
seen a PPC.

Gateway wouldn't pay $40 mill for a virtually dead platform with only a
small user base and then spend money on redevelopment to sell rebadged
PC's. Who'd buy them ?, Amigans certailny wouldn't and neither would Joe
Blow.

>
> Basicly it's a completely new computer and OS with the Amiga name on it.
It's like
> buying a PC whith the Commodore sign on it. It has got nothing at all to
do with
> Commodore.

It's for real dude, and it's an Amiga and it's not a PC.
I can't see a PC being 5-10X faster then the current PII by end 1999.

Besides, what the hell is the problem with having another alternative to
Intel ?.

Sour grapes ?
:-)

Regards,

Clockmeister.

The Alpha 21264 is, esp. on the floatingpoint part. Integer
specs are a bit less. And this processor is shiping now. It's
not some magical vapor ware like Intel Merced or a 'quantum
processor' to be released in 1999. It is simply the fastest

processor available.

Bye, Hans

For the mouse, check out the Quick FAQ. You can use a PC serial mouse if
you sacrifice your serial port.

The DMA HD is a pin to pin cable AFAIK. You can either make one
yourself, get it made by someone near you, or buy an equivalent cable
(19pin to 19pin).

Cheers,
Nick

5-10x times faster than what? A sluggish 266MHz P2, or a 400MHz? I wonder how they define "todays PCs"?

And which is this mysterious CPU?

> Besides, what the hell is the problem with having another alternative to
> Intel ?.

Nothing! Did you say that?

> Sour grapes ?

For what? I think you have missed something obvious and the funny thing is that
you doesn't even know it.

The current Alpha (available since last year) is 4-7 times as fast
as a P2. Next one out next year will be between 8-15 times as fast.

Maybe I missed it, but how do you ?convert? .tos and .msd files etc..?
for 1040stf? are these files not for my system?
Thanks,
Christian

TT RAM chips must be 30 pin 1Mb or 4Mb x 8 non-parity nybble mode SIMMs.

^^^^^^^^^^^^^^^^^^^

The 8 means 8 chips on each memory card, NOT 9 or 3, they will not work.
I purchased my chips through Memory Supersource 1-800-457-6837.
Item #   WM4000870S 4MX8 70NS SIMMS

The newer TT RAM boards it will have 6 jumpers labeled w101 to w106.
The jumpers settings are as follows:

	w101	w102	w106
1M x 8 SIMMs (4MB)	2-3	2-3	2-3
4M x 8 SIMMs (16MB)	1-2	1-2	1-2

jumpers w103 & w104 are for the start address remain the same 2-3
jumper   w105 is for burst mode ON 2-3   OFF 1-2

Titanic was officially render on Alphas running Linux.
Amiga can probably do that, they did an great job in babylon 5, but the
Titanic team decided to use Alpha/Linux combination.

Hello

I have an Atari that has not been used for about 2 years.

I am having problems getting the hard drive to go. I know the hard drive is
about 20 Meg with partitions. The Hard Drive Unit was Custom built so I
don't know what type it is.

I have had the Hard Drive unit working with AHDI Driver about 2 Years ago

I have AHDI/SHDRIVER v5.00 & HDX v5.00

When I boot I get the following message

ACSI Devices :
Unit 0 Identification unavailable

I have created an icon for the d drive. But I get an error saying the drive does not exist.

Any Help welcome

Regards

Clive Gordon

Have you tried booting AHDI from floppy ? Shouldn't the drive letter be C (capital C, not c which is the cartridge port) rather than D ?

Old HDs usually end their life "sticking", the heads stick to the disk surface which cannot spin. Is your disk spinning ? Not the fan, the drive itself ?

When this occurs, one remedy is to disassemble the unit and take out the drive mechanism. Hold the drive in your hand horizontally, switch the drive on, and give it a circular horizontal shake, just to unstick the head and get it spinnig again. This works sometimes. If it does work, backup all your data and never switch the drive off again.

Cheers,
Nick

.TOS are TOS executable files, you know, programs. That's in the FAQ I'm sure. Just double click on them. The difference between TOS and PRG/APP programs is usually that TOS ones run text mode, whereas PRG or APP are GEM driven.

I don't know what .MSD is. I think you mean .MSA, which is a compressed disk image format (usually used for pirate games or demos). You need MSA2.3 to decompress an MSA file to a disk. You'll find it on most FTP sites, like ftp.lip6.fr.

Cheers,
Nick

Subject: what upgrade options for 520STFM
Date: 1998/07/04
Message-ID: <6nks7m$7me$1@news5.jaring.my>#1/1
X-Deja-AN: 368623564
X-MimeOLE: Produced By Microsoft MimeOLE V4.72.2106.4
Organization: Unconfigured
Newsgroups: comp.sys.atari.st.tech

hi all,

i need help!

i have a 520STFM machine bought "10yrs" ago. I upgraded it to 1MB RAM then stored
it away (?!!)

i'm now thinking of pulling out of "cold storage" and using it to run Linux and games...
from the ST websites i've visited, i noticed that my 520STFM is very much "underpowered" !!

so, i want to upgrade it using "standard" parts...

i've found out how to wire a standard VGA monitor for use with the ST. (from the ST
Quick FAQ and others documents)   i'm pretty confident of pulling this one off !

my problem is... how to increase my RAM to at least 2.5 MB RAM
(i'll try changing one bank first).
all the documents i found to do this is for the 16 256K DRAM chips (per bank) type.
16X256K=4096K=4MB ??
my 520STFM has only 4 DRAM chips in one bank. (1MB = 8 chips in 2 banks(rows))
the DRAM chip number is TC514256P-10. What kind of DRAM chips are these?

furthermore, instead of the usual 16 pin (8 pins per side), my RAM chips are of the
20 pin (10 per side) type !!

My questions are...

1. Anybody did an upgrade for "this type" of 520STFM?
2. Anybody knows where i can find the "complete" document to do this upgrade procedure?
3. If there is no written procedure... any help is appreciated?
    I believe i would need a pin out configuration of the DRAM chips i have,
    anybody can help?

Sorry, to have to bring this RAM upgrade thing up... (i know it's been pretty talked about)
but i'm at wits end thinking what to do... everywhere on the web i've looked leads to a
dead end.

If i don't get a solution here, i think i will have to pack up my ST again and this time
give it a proper burial... and get a PC !! (I hope not...)

TIA.
cml

Anyone got these CDROM drives working on Atari or know how I can? Any help appreciatted.

Please note I haven't actually tried them yet. I only got the drives yesterday.

I've got Extendos Pro will that pick either of them up for reading.

So far the PC picked up the Pioneer no problem.

For my old LC Mac I had to hunt for a driver which I found with regards the Pioneer.

I haven't actually tried the Ricoh with the PC yet but do have software to install for it.

The Ricoh on the Mac, no joy so far.

Hello users,
Has anyone experienced this before? My Megafile is causing the Mega 2 to come up with no icons on the desktop. The Mega 2 boots fine from a floppy as long as the HD is not connected. If it is connected, powered up or not, no icons. I've ruled out the Mega 2 because the problem doesn't occur with my SH204. Changing HD cables doesn't solve it and hooking up the Megafile

to a different ST causes the same problem. Any ideas out there? Thanks.

Yes, you can boot from the ZIP like from any other drive, regardless if it's a hard disk or a removable drive. This has never been a problem.

>
> Which one is correct ?

It's the latter, from what I've gathered. This was discussed a few weeks ago on ZDTV (a computer cable network). But when a drive says it's, say, 32x, it's only talking about 32x *maximum* and it's much faster reading data on the inside of the disc than it is on the outside of the disc. So it's 32x at the very inside of the disc, but much slower on the outside of the disc.

However, there was one manufacturer on there (don't remember who it was), who now uses 7 lasers on their read head, which supposedly makes their drive a true 7x whatever the speed rating of the drive is. So a 3x drive would turn into a 21x drive.

Hi Uwe,

Thanks,

Does it matter that a boot drive is Atari formatted or pc DOS formatted.

And if you can boot a DOS formatted drive, how do you go about that?

I have a 500Mb scsi drive in a ICD FA*ST acsi to scsi box, I formatted
the hard drive on my pc to get the one large partition. I have ICD utilities
but when I set the scsi hard drive as the boot drive the software reports
that I can't use the 500mb drive as a boot drive. I also tried this with
just
my scsi zip attached to the ICD box and got the same thing.

At the moment I'm booting from a floppy but it sure would be nice to
boot from the hard drive.

I appreciate everyone's input.

Charlie

I have read the FAQ, maybe I missed what I was looking for, so here goes. I
got a bare 520 for $2 at a local swap meet. Never had an Atari, I had an

Amiga, but I wanted to try one out. My question is, how do I know what type of TOS, if any, I have. My board is Rev.H with six EPROM plugs on the left side. A seventh longer one sits above and offset to the right. The 520 has no floppy drive. It does have an RF modulator. What do I have to do to get it running? I have a source for a p/s I think, but I need to know about the TOS. I am also going to use a PC serial mouse for now. Any thoughts. THanks.:)

Hi All,

Yesterday I managed to accidently select the Recover Partition Data option from the HD Driver v6 Hard Disk menu. This has now messed up the partition information on my Hades and now when it boots I get an Illegal Instruction error message and a lot of HEX numbers. I have been trying to boot from floppy disk by holding down the Alt key at boot up as this works on a Falcon.

I am really stuck as I cannot boot to the desktop and therefore I cannot re-partition my Hard Disk (IDE) to be able to perform a restore.

As the Hades is a TT clone does anybody know how to boot a TT/Hades from floppy?

Any help would be greatly appreciated as I cannot use my Hades until I have fixed this problem.

Please could you send any replies to me via Email - ben@imperial.co.uk

Thanks,

Regards,

Ben Hills.

The article was from First! by NewsEdge Corp. You can find them on
http://www.newspage.com, but that was several weeks ago.

The were using some of their own programs. I cannot recall what's the name of
the program.

In an ST it would be only 1.0 I suppose. If it's an STF it could be 1.0 or
1.4.

The best way to know is to run a program such as sysinfo.prg. It can be
found on several FTP sites.

Cheers,

Nick

I would think that the Alphas only did the rendering, so it shouldn't be to hard

to
port a
renderer to it. The editing probably took place one something else.

Can you access the drive if you boot from a floppy (drive switched off)
and THEN switch on and run AHDI ?

It could simply be a corrupted desktop.inf file, since that is where the
icon information is kept. If so, once you have access to the drive,
delete it, and save a new one.

Cheers,
Nick

outrider@lvdi.net scribbled:

: It's the latter, from what I've gathered. This was discussed a few
: weeks ago on ZDTV (a computer cable network). But when a drive says
: it's, say, 32x, it's only talking about 32x *maximum* and it's much
: faster reading data on the inside of the disc than it is on the
: outside of the disc. So it's 32x at the very inside of the disc, but
: much slower on the outside of the disc.

Halt ! I think we're talking about different subjects here. I assume you refer to inside RPM and outer side RPM. That indeed differs. But what I want to know is : does the speed factor refer to the _internal_data_rate_ (!= inside RPM), that is the speed the laser picks up data from the disc, measured in K/sec, or to the external data rate, that is, the speed at which data is transferred from CD-player to host/computer ?

Thanks anyway for making me restate my question. I admit it may have been ambiguous at first.

Cheers,

No, I do not think it has anything to do with any file.
If no icon appears (I suppose the trash bin is displayed!) it depends on
the DMA subsystem. As the error is already located in the MEGAFILE, I
would recommend replacing the hard disk controller inside the MEGAFILE
case. Could be difficult to find another one...
```

Just my opinion,

Hi Nick!

Sorry to add my 2 pence again:
As it refers to 520STM without floppy, it can be TOS 1.00 (built
1986), TOS 1.02 (built 1987), or (as there are EPROMs) afterwards equipped

TOS 1.04 (Rainbow TOS, built 1989).

Rainbow TOS can be determined by the rainbow-like flickering of the ATARI Fuji logo in "Desktop info..." menu entry in color mode, easily to be tested with a color TV connected to the RF modulator output of the ST.

Apart from that, in color or b/w mode you can recognise TOS 1.00 and 1.02 by the date shown in the "Desktop info".

Hope to have helped,
Carsten

On Sun, 5 Jul 1998, Charlie Wood wrote:

> Does it matter that a boot drive is Atari formatted or pc DOS formatted.

You cannot boot from a DOS compatible drive because of many little differences in the partioning structure, at first the different requested checksums of the root sector (Master Boot Record).

You can have your boot partition on a DOS compatible formatted and partitioned hard drive, but you cannot install an auto-booting ATARI hard disk driver on it.

Hope to have helped,
Carsten

Anyone using Linux on a F030?
Where do I get the Linux CD?
What is required?

MG

Hi,

I posted this question a while ago, but the answer I got proved incorrect.

My question : how do I configure GS_LIB in stgs.rc ? The manual refers to the file for correct syntax, but mine is screwed, so I'm stuck.

Please, I do appreciate the effort, but do NOT try to quote it by heart ; just send me a copy of the original file if possible, or an extract. BTW, I have already tried a zillion combinations of "setenv", "GS_LIB" and the correct path, e.g. "setenv GS_LIB=d:\tmp\gs\ps,d:\tmp\gs\fonts,." .

Thanks a lot,

```

Hello everybody!

Every now and then the question of using 1.44Mb (HD) disks on the Atari ST arises. Here's my contribution to the discussion, a complete description of a circuit that allows ANY combination of 720Kb/1.44Mb disks. It will even work fine without any highdensity diskdrives, which is rather pointless for anything but testing...

This circuit has been tested and used in all ST/STE:s I could lay my hands on, however, I've only used the mentioned TEAC drives.

The article was initially written for Atari Computing, but it seems they won't print it, so I'm setting it free to the Atari community worldwide. You can copy it as much as your heart desires, store it in BBS:es, print it out and send it to your friends. Translations to other languages are encouraged as well. And please forgive me for possibly maltreating the English language, it is my fourth language and nobody's perfect.

To my knowledge there are no translations yet, and for swedish readers, no, there is no Swedish version! I wrote it in English from the beginning.

This is the only time I'm putting this article on the Usenet, but critics and comments are always welcome!

Martin Graiter

-+-

Build your own DD-HD switch for the Atari ST/STE.

�1997-1998 Martin Graiter

So you want to use 1.44Mb floppies? And your old 720Kb floppies as well? No problem! Here's a one-chip solution that takes care of things for you! Before you start you should consider the following:

If you don't feel confident with an Ohm-meter and a soldering iron, or if you're not familiar with schematics, then don't attempt this project. There is no shame in not being skilled with everything on earth. I also sell ready-built DD-HD circuits, built and tested to function. Maybe you should rather buy one and then only solder 5 wires instead of going through all the moments of measuring, soldering and fault-searching?

This modification is unnecessary for the MegaSTE, TT, and Falcon, because they can already deal with HD floppies "from factory".
In order to use HD floppies you MUST have a 1.44MB (sometimes referred to as 2Mb) diskdrive. The old SF314 won't do the job. Teac's FD235HF-drives are suitable, as is Sony's model MPF520-1. There are other drives too, but I can't name them all here.

If the diskdrive outputs a High Density Detect (HDD) signal on pin 2 of it's bus, then it's suitable! This signal has sofar (in my experience) always been positive logic (active high). Means that when you have a DD disk in the drive, the output on pin 2 will be LOW (0V). When an HD disk is inserted the signal will shift to HIGH (+5V).

You also have to have a suitable Floppy Disk Controller (FDC) chip in your machine. If your chip has the marking "WD1772 02-02" it is OK. Also if the marking is "Atari XXXXXX (lots of numbers)" it will work.

But if your chip says "VLSI" or "WD1772 00-00" it will most likely NOT function. In that case I suggest you swap with someone, or buy another FDC. Additionally you need a program that will change the steprate to 6ms (milliseconds), Fastcopy, Bootsie, Flopcontrol are such programs, but there are others too. I patched my TOS 2.06 so that the default steprate is 6ms instead of 3ms. No program needed after that.

And finally you need HD disks. PLEASE don't use your old 720Kb disks for this! Some people have drilled holes in their DD disks as to fool the diskdrive to format them at 1.44Mb. This is an extremely bad idea!!! You'll be sorry you did it, I promise!
Don't go the other way either! I don't want to go into discussions on why or what happens, but you'll regret this too! Disks are cheap, just buy a pack (or loan one from your buddy).

And now some theory:

The WD1772 chip is designed to work at 8MHz, but thanks to the good quality of the chips produced, this can be greatly overdriven. Most WD1772:s will happily hop along at 16MHz, and even at 32MHz! In order to run 1.44Mb disks we will overclock the WD1772 to double speed, 16MHz. Since we're interested in using the old 720Kb disks as well, we'll want to switch between 8 and 16 MHz alternatively. That can of course be realized by hand switching, but more elegant is to perform this automatically. Which is precisely what we'll do here!

If you study and comprehend my schematics you will probably figure out how to be able to use even 2.88Mb disks? I didn't bother, since 1.44 disks is the standard nowadays.

A positive effect of this clock doubling is that the data transfer rate between the DMA and the FDC also doubles!
However, all timings are half as long and so is the steprate. Instead of getting 3ms we get 1.5ms when running at 16 MHz. To rectify this we set the steprate to 6ms, which gives 3ms in reality (since everything is halfed at 16MHz). You follow? It doesn't matter that the steprate becomes 6ms when running at 8MHz, it just makes the drive somewhat noisier.

We also need to break the connection of pin 18 of the FDC, (which is CLK IN,) from the permanent 8MHz feed and instead feed the pin with the output from our circuit.

In order to perform an automatic switching between 8MHz (720Kb DD-disks) and 16MHz (1.44Mb HD-disks), depending on what types od disks we put in our A and B drives, we will utilize the services of a 74LS151 chip.

General pinout for the 74LS151:

```
           74LS151
         +---\_/---+                         D0-D7 are data INPUTS
```

```
      D3 |1       16| +5V
      D2 |2       15| D4
      D1 |3       14| D5
      D0 |4       13| D6
DATA OUT |5       12| D7
DATA OUT |6       11| DATA SELECT A
  STROBE |7       10| DATA SELECT B
     GND |8        9| DATA SELECT C
         +---------+
```

This chip has 3 control inputs, A,B,C, that will determine which of eight input lines will "come out". We feed half of the input lines with 8MHz and the other half with 16MHz. The control lines will be High Density Detect from drive A (HDD0) and High Density Detect from drive B (HDD1). We will also use the signal Drive Select 1 (DS1), which activates drive B. We needn't use Drive Select 0 (DS0) since we simply assume that DS0 should count as active if DS1 isn't. Note that this signal is negative logic (active low).

Next step will be to make a truth table, as to determine which inputs shall be fed 8MHz and which 16MHz. It looks like this:

```
A=DS1                     C B A
B=HDD0                    ------+
C=HDD1                    0 0 0 |D0 --> 8
                          0 0 1 |D1 --> 8
                          0 1 0 |D2 --> 8
                          0 1 1 |D3 -->16
                          1 0 0 |D4 -->16
                          1 0 1 |D5 --> 8
                          1 1 0 |D6 -->16
                          1 1 1 |D7 -->16
```

The only thing left is to tie STROBE to GND (to enable the chip) and we're done! We substitute the D0-7 markings with 8 and 16MHz respectively, we do the same with the ABC select lines, only here we put in the names of our signals as above to the left. That's it!

Logical schematic of the DD-HD switching:

```
                                    74LS151
         +-------+                +--------+
         | 16MHz |------>2,12,13,14|        |
         +-------+                |        |
                                  |        |
         +-------+                 |        |
         |  8MHz |-------->1,3,4,15|        |
         +-------+                 |        |
                                   |        |
                  DS1----------->11|        |
HDD0--------+------------------->10|        |
            |     HDD1-----+----> 9|        |
           _|_            _|_      |        |
          | R |          | R | +--7|STROBE  |5-->CLK OUT
          |2K2|          |2K2| |   |        |
          |   |          |   | |   +--------+
          +---+          +---+ |     8    16
            |              |   |     |     |
            +--------------+---+-----+GND  +5V
```

After theory we only need to realize the circuit in real life. You will find 16 MHz on pin 39 of the SHIFTER (not on the STE!) and 8MHz in the empty hole where pin 18 of the FDC used to be. DS1 is found on pin 19 of the PSG (Yamaha YM2149 or General Instruments, GI, AY-3-8910). Ground and +5V can be found everywhere on the motherboard.

Connections in the function as
DD-HD switcher:

```
          74LS151                            16MHz quartz crystal
        +---\_/---+                             +---------\
  16MHz |1      16| +5V                      NC |1      14| +5V
   8MHz |2      15| 16MHz                       |         |
   8MHz |3      14|  8MHz                       |         |
   8MHz |4      13| 16MHz                       |         |
CLK OUT |5      12| 16MHz                       |         |
     NC |6      11| DS1                         |         |
    GND |7      10| HDD0                    GND |7       8|-->16MHz
    GND |8       9| HDD1                        \---------/
        +---------+
```

If you have an STE model you will also have to add a quartz crystal, this because the STE doesn't have a good enough 16MHz signal for our purposes. Easiest is to use the type with 4 pins, it is defined as above.
The numbering of the legs is correct, even though there are only four of them!

A good general advice is to keep the connecting lines as short as possible, also determine exactly where you'll put our little circuit before you start connecting things� Before we get our hands on the actual making of the switcher, we have to consider the signals HDD0 and HDD1.

The HDD0 signal has to be connected to the second wire of the floppy ribbon cable. The first cable is normally coloured red or dotted red. You can carefully cut free about 2cm (one inch) of wire no 2 from its "neighbours". Then you can cut it off at the side closest to the motherboard connector. Peel off the plastic isolator a couple of mm on the end. This naked thread you'll solder to the HDD0 wire coming from our little board. It is good practice to isolate the connection with some shrink-tube (I am not sure this is the correct English word? I'm talking about a small hose made of a material that shrinks when you heat it.)

```
          ___________________________________________________
|       4|_________________________________________________4_|        |
|       3|_________________________________________________3_|        |
|       2|_____|_CUT HERE!|________________________________2_|        |
|       1|_________________________________________________1_|        |
+--------+                                                   +--------+
Motherboard                                                   Floppy
connector                                                     connector
```

Alternatively you can connect to this wire by going to the underside of the motherboard. There you'll seek up the solder joints for the floppy cable. It will look something like this:

```
                                       []()()()()()()()()()()()()()()()()
                               pin 2-->()()()()()()()()()()()()()()()()()
```

You will recognize pin 1 by the rectangular pad, no 2 is right below no 1. If you decide on this solution you shall not cut the wire as described above!

It is important that you lead your wire to the upper (component) side without using holes that will accomodate screws or plugs when the case is reassembled!

The HDD1 signal is to be connected to pin 7 of the connector for the external drive. This pin is grounded and you'll need to disconnect it from ground. You can do that by either cutting it off and bending up what's left, as depicted in the drawing below. Or, you can play dentist and pull it out from it's hole on the underside. This means you'll have to suck the hole clean from solder and be sure that the pin will move freely! You can also keep your soldering iron to the hole and then pull the pin out from the other side. Of course, the rest of the pin must remain in the circular connector!

```
      Right side view:                  Outer view:
              ______________||
             |--------------||          11       10
             |--------------||
        +----|              ||       9                8
        ||   |              ||
       _||_  |     CUT!     ||     7     13     12     6
      ||  |  |    /         ||
      ||  |  |   /          ||      5       14        4
      ||  |  |__/___________||
      ||__|___|| |     |    ||         3          2
      ||      ||_|     |____||               1
      ||                    ||
```

Should you decide that you'll never need to connect an external (B:) 1.44 drive to your machine, well, then there is no need to do this at all! The HDD1 signal is already defined as LOW through the 2K2 resistor connecting it to ground. In fact, if you won't connect any 1.44 diskdrive as B: you can just tie HDD1 to ground, with or without any resistor. You will still be able to use 720Kb diskdrives on B: if you want to.

Those who have the (good old) 520ST without internal drive will in any event have to do the above mentioned modification, with the HDD0 connected to pin 7! Should there be need for an HD drive as B:, then an extra hole will have to be drilled in the 520ST case and an extra wire drawn from B:s pin 7 to HDD1.

These are the appropriate connections to make if you want to make your own cable from the external circular connector to the rectangular Shugart connector on the floppy itself:

```
External circular             Shugart
connector                     connector

01.  Read Data-----------------30. RDT
02.  Side 0 Select-------------32. SSL
03.  GND----------------------- 1,3,5,7,9� (all odd wires are GND)
04.  Index Pulse--------------- 8. IDX
05.  Drive 0 Select------------10. DS0
06.  Drive 1 Select------------12. DS1
07.  High Density Detect------- 2. HDD
08.  Motor On------------------16. MON
09.  Direction In--------------18. DIR
10.  Step----------------------20. STP
11.  Write Data----------------22. WDT
12.  Write Gate----------------24. WGT
```

```
13.  Track 00------------------26. TR0
14.  Write Protect-------------28. WPT
```

And now, let's get hands on the very DD-HD switcher! If you plan to build this on a veroboard, I'd suggest the following approach:

```
---------------------------------------------------------------------------
           VERSION FOR THE ST RANGE, NOT FOR THE STE!
---------------------------------------------------------------------------
```

What you need: 1*74LS151 chip
1*220 ohm resistor
2*2.2 Kohm resistors
1*3mm LED

Cut a piece of veroboard that is 9 modules high and 6 modules wide.

This is the intended component placement:

```
                                                             |+5V
  6   5   4   3   2   1                  1   2   3   4   5   |6
+---+---+---+---+---+---+              +---+---+---+---+---+-|-+
| 0 | 0 | 0 | 0 | 0 | 0 |         16MHz| 0   0----\_/----0   0 |
|   |   |   |   |   |   |              |     |           |  _|_|
| 0 | 0 | 0 | 0 | 0 | 0 |              |     0           0 |   |
|   |   |   |   |   |   |              |     |           | | R |
| 0 | 0 | 0 | 0 | 0 | 0 |              |     0           0 |220|
|   |   |   |   |   |   |              |     |           | |Ohm|
| 0 | 0 | 0 | 0 | 0 | 0 |          8MHz| 0   0           0 |___|
|   |   |   |   |   |   |              |     |           |   | |
| 0 | 0 | 0 | 0 | 0 | 0 |              |     0           0   0 |
|   |   |   |   |   |   |              |     |           |     | Anode
| 0 | 0 | 0 | 0 | 0 | 0 |              |     0           0   0 | (+)
|   |   |   |   |   |   |              |     |           | (LED)
| 0 | 0 | 0 | 0 | 0 | 0 |              |     0           0   0 | (-)
|   |   |   |   |   |   |              |     |           |     | Cathode

   UNDERSIDE                                    UPPER SIDE
```

The two 2K2 resistors will be standing up, the LED and it's 220 resistor aren't necessary for the function, but will indicate that you've found +5V and GND (by emitting light) and it will impress your friends!

But, no point in placing out the components yet, first you'll have to prepare your veroboard! You will start by cutting lanes at appropriate locations. When all up-down DISconnections are made, we will also need to make left-right CONnections. We will achieve that without using one single wire!

Preparation of the underside:

Start disconnecting the up-down lanes by cutting traces in them as shown in the left figure.

Continue by inserting the chip and making the sideways connections by soldering drops of resin across the dividing lines.

```

```

Insert also the other components and make sure you're not cutting off the long wires on the ends of the resistors which will go to GND and +5V on the motherboard. See the figure with the component placement.
You will now need to determine where on your motherboard you'll be placing the DD-HD switcher. Best is a location close to the FDC. The signals CLK OUT, 16MHz and 8MHz should be as close as possible, as to keep wires short.

Here is a suggestion for the placement in the Mega ST models:

```
       ============
        |   ||   |  External floppy connector
        |   ||   |

VERSION FOR THE STE RANGE!

(can also be used on ST machines!)

This version has simply been "stretched" in order to accomodate an added component, the quartz crystal. On most STE:s you can't utilize the 16MHz signal present on the motherboard. Nothing prevents this design from working on an ordinary ST as well. It's just a matter of economy, the crystal is an extra cost.

What you need: 1*74LS151 chip
1*220 ohm resistor
2*2.2 Kohm resistors
1*3mm LED

```
               1*16MHz quartz crystal
```

Component side:

```
                             |+5V
                             |
       +---------------------|---------------------+
       |     O----\_/----O   O                     |
       |     |           |  _|_                    |
       |     O           O |   |   +---------------\
       |     |           | | R |   | o           o |
       |     O           O |220|   |NC          +5v|
       |     |           | |Ohm|   |               |
   8MHz| O   o  74LS151  O |___|   |               |
       |     |           |   |     |     16MHz     |
       |     O           O   O     |               |
       |     |           |         |               |
       |     O           O   O     |               |
       |     |           | (LED)   |               |
       |     O           O   O     | GND      16MHz|
       |     |           |         | o           o |
       |     O-----------O         \---------------/
       |      /-----\R2K2 ___                      |
CLK OUT| O   O   O   O   O___O                     |
       +---------|---|---|-------------------------+
             |  DS1 HDD0 HDD1|
          GND|               |GND
```

For this version of the DD-HD switcher we need a somewhat bigger veroboard, 9*11 modules (holes). We will prepare it in similar manner to the previous design, by cutting DISconnections on the vertical lanes:

```
        11  10   9   8   7   6   5   4   3   2   1
       +---+---+---+---+---+---+---+---+---+---+---+
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |   |   |===|   |===|===|===|   |===|===|
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |   |   |===|   |   |===|===|===|   |   |
       | O | O | O | O | O | O | O | O | O | O | O |
       |===|===|===|===|===|   |===|===|===|   |   |
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |===|===|===|===|===|   |   |   |===|===|
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |   |   |   |   |   |===|===|===|===|   |
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |   |   |   |   |===|===|===|   |===|   |
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |   |   |   |   |   |===|   |   |   |   |
       | O | O | O | O | O | O | O | O | O | O | O |
       |   |   |   |   |   |   |   |   |   |   |   |
       | O | O | O | O | O | O | O | O | O | O | O |
       +---+---+---+---+---+---+---+---+---+---+---+
```

Next step is to make horizontal CONnections between the lanes. You will insert the components from the other side before you go about it. The modules should have connections as in the drawing below:

```
         11  10  9   8   7   6   5   4   3   2   1
       +-------------------------------+-----------+
       | O   O   O   O   O   O   O   O | O   O   O |
       |           +---+   +-----------+   +-------|
       | O   O   O | O | O | O   O   O   O | O   O |
       |           +---+   |   +-----------+       |
       | O   O   O   O   O | O | O   O   O   O   O |
       +-------------------+   +-----------+       |
       | O   O   O   O   O   O   O   O   O | O   O |
       |   +---------------+---+           +-------+
       | O | O   O   O   O | O | O   O   O | O   O |
       |   |               |   +-----------+---+   |
       | O | O   O   O   O | O | O   O   O | O | O |
       |   |               +---+-------+   +---+   |
       | O | O   O   O   O   O | O   O | O | O | O |
       |   |                   +---+   |   |   |   |
       | O | O   O   O   O   O | O | O | O | O | O |
       |   |                   |   |   |   |   |   |
       | O | O   O   O   O   O | O | O | O | O | O |
       +---+-------------------+---+---+---+---+---+
```

It is advisable to measure between the "fields" with a resistance meter, to make sure that there are no connections where there shouldn't be! Here you won't have to connect a 16MHz wire to the motherboard, since that signal is generated "on board".

After you've assembled the veroboard, you'll have to make connections to the motherboard too.

Placement in an STE:

If you place your switcher just above the FDC chip, you'll have easy access to all relevant solder points on the motherboard. You will find a nice hole for your DS1 wire on the rightmost (no 1) hole of W300. There will also be a convenient via just to the right of C305 where you can take your 8MHz signal. GND and +5V can be taken from the proper sides of the capacitors C303 and C304. GND is also found on pin 14 of the FDC.

```

```

This project is Bed & Breakfast ware. I expect you to accomodate me for one night and one breakfast should I decide to visit your town. (I like to travel) Send me a postcard with your name and adress if you use it in your computer! Email is nice too, but postcards are preferred! Commercial use is granted as long as a licencing fee is payed to me.

I am looking for ways to expand a Mega STE.
First off a video card would be nice. Are there any available?
Also any speed improvement would be nice.

Thanks,
David Baisley

Greetings,

I recently purchased a Nove VME adapter for my Atari TT. I will be using an ATI Mach64 video card with the adapter. Unfortunately, I do not have the installation diskette. Is there anyone out there using a Nova adapter that has the installation diskette, that would be willing to transmit the contents of the diskette to me via e-mail? Are these available for download anywhere?

Thanks!

What software are you using ?

BTW, DO NOT FORMAT AN IDE DRIVE, just partition it.

Cheers,
Nick

Just run a small C routine to add 20 years to the systems clock when it boots
to 1980 in the year 2000.

Works for me!

I've got some synth modules and Atari-specific software to go with
them for sale B/O:

Roland MT32, LA Custom Instruments/Robin Whittle mods, battery backup
memory and controllers for reverb, S/N ratio cut to 85db or better
even with reverb up full. Also, MT32 Capture! editing software. Many
banks of patches on disk.

Akai S612 Sampler and drive/w some disks, lots of samples. Also
Drumware sample editing software for same.

Manuals for all.

While we're on the subject, is it physically possible to use serial1/2 and
a VME card (e.g. Riebl ethernet) at the same time?

I thought I'd seen an article recently explaining how to do this, but I
can't find it in dejanews ...

Aha, interresting. It's called 68150 BTW. I wonder how much it costs and if it
would
have
made the AB040 cheaper and faster if it was used insteed of all those PLDs doing
the
same
work.

A quick search in Motorolas price list (Q2-98) tells us that the 25/33mhz part costs $12 in quantiys of 18, same price for 250 pcs.

The 40Mhz part is slightly more expensive at $12.75.

If it would have been faster/cheeper it surely would have been used. But who knows? Unless someone wants to hack the AB and use on of these instead...

Regards..

As far as video cards, the following are available for the Mega STe's VME bus:

Crazy Dots (Gribnif still might have some)
Nova cards (do a search for Homa Systems)
CyRel Sunrise Cards (used to be imported by Cybercube)

Used card are definitely hard to find and there are probably more that I
just don't recall. Hope it helps, though.

is it possible to daisy chain 2 FA-ST ICD HD cases with 2 hard drives apiece... (4 HDs all together)... each ICD case has its own ICD host adapter... other than ensuring each HD has a unique SCSI number and that only the last HD in the chain has the terminator resistors in place, is there anything that should be done to the 1st (or last) host adapter in the chain?...

thanks

Yes it's possible to use serial1/2 and a VME card at the same time. Just let the serial1/2 port hanging out of the TT and install the VME card above the serial1/2 flatcable.

If you have purchased a used copy of STalker and have the original disk, for a small fee you can have it rewritten so that you can re-register the program in your own name. Send email to gribnif@pair.com if interested.

The Atari A-Z book by Mark Baines includes some text on TT or Fast RAM and
the 68030:

~~~~~

[Fast RAM] uses nybble mode to facilitate burst mode filling of the 68030 caches, which means that the CPU fills its cache at one cycle per subsequent access. Fast RAM is avaolable on the TT only through an expansion board with its own MCU. A board contains four SIMM slots allowing 4Mb or 16Mb of RAM with 1MBit or 4MBit chips. A switch on the TT can be selected to place this RAM in burst mode and another set of jumpers can select its start address which is normally $01000000.

Burst mode transfers of data (on the 68030 chip) allows the reading of four 32-bit long words in just five clock cycles and the internal architecture allows data and instructions to move within the chip on seperate buses concurrently.

~~~~~

Note, this text obviously applies to the Atari or GESoft TTRAM boardsthat take 30-pin SIMMs.

 j> I've just installed a aixTT fastRAM-card with 32MB EDO, do you know
 j> if this configuration supports burst-mode? The aixTT "documentation"
 j> doesn't mention this.

I don't know whether this applies with 72-pin SIMMs.

Welcome to the club btw. I also have 32Mb in an AixTT board B^{)

Doesn't sounds to expensive so I would guess it would have been much
cheaper if they had used one of those insteed. But for now I will settle
down with a 060 with L2 cache in my AB040! :-)))

This should be OK.

But note ..... the units are chained on the DMA connection. Each unit
will have its own SCSI bus and it is the last unit on each SCSI bus
(i.e. 2 devices) which need to be terminated.

You could tidy the whole thing up (and make a bit of cash from the
spare adapter) if you just extended the SCSI bus of one adapter to the
other two drives.

You will (if you don't plan on putting all the drives on the same SCSI chain) have to ensure that the ICD host adaptors have unique SCSI IDs as well. IIRC, ICD host adaptors have a default ID of 6, and I don't know if it can be changed.

Yo! Dude's!

Has anyone else in here got an MV 300 graphics card in their machine.

I need some information with regard to availability of True colour drivers.
I'd also like to know if anyone has got a different version of NVDI to work,
ive only been able to use a special version 4.10 so far.

What version XBIOS300 driver do you have.
What other information can you provide me with.

Thanks in advance.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

:
: I'm trying to connect my falcon to my linux box via a null modem cable.
: I've set Modem 2 to active under sting and run pppd on the linux box.
:
: Packets are transfered but the linux box is dropping any packets that
: sting sends. Because of this the ppp negotiation is not performed and
: I can't connect the machines.
:
: Has anyone got experience of a similar setup?

What don't you use a SLIP connection with slattach in Linux. That should work (at least, under Mint it works).

For the main reason that slattach does not appear to be on my machine and
as I don't use SLIP then there is no need for me to add it.

Anyway I've sorted it out now. I thought I had the latest versions of the
Sting packages but it turned out I didn't. Its now working with the
March 10th(?) modules added.
Its a bit slow though, I'm only getting about about 500 cps with cab and
1000 cps using aftp.

At what port-speeds ? AFAIK, in my set-up, the rates were as high as
one could expect, both with CAB and its built-in FTP client.

BTW, "David De Ridder" translated to English would be "David [The] Knight".

 sc> drives apiece... (4 HDs all together)... each ICD case has its own
 sc> ICD host adapter... other than ensuring each HD has a unique SCSI
 sc> number and that only the last HD in the chain has the terminator
 sc> resistors in place, is there anything that should be done to the 1st
 sc> (or last) host adapter in the chain?...

Just plug the DMA out of the first hard drive to the DMA in of the second and it should work.

I think that you will need to terminate the last drive in each box since one pair of drives aren't daisy-chained to the other in the conventional SCSI way

Speak to 'ya later!

Hi

Maplins do them, as far as I know they do. Most GOOD electronic shops should be able sort you a cover out as the same covers aren't just used for the SCSI end of a cable; it is on the DMA-SCSI adaptor I have here:)

Cheers! for now
Steve

English document not yet available. My apologies to all English speaking
customers.....
But give it a try: Change working directoy to "disks-m68k" and your platform
(atari for excample) and start the bootstrapper. (bootstra.ttp f.e.) After
that follow the instructions on your monitor.
You will find some useful informations in the misc directories, too. (doc/html)

Dies ist ein kompletter Abzug der Archive auf ftp.de.debian.org
sowie PGP 5.0 in der _legal_ exportierten Source Code Form und weiterer
zusaetzlicher Utilities. DIESE CD DARF IN DIESER CD FORM NICHT KOPIERT WERDEN!
(Bitte halten Sie sich an dieses Copyright, in dieser CD steckt eine Menge Arbeit,
und wir m�chten auch in Zukunft diese Distribution pflegen koennen. Sie
funktioniert
uebrigens theoretisch mit einem Amiga oder Apple ebenso, wie mit einem Atari!)
Leider wird derzeit der Milan noch nicht unterst�tzt, aber es arbeiten bereits
einige
Entwickler daran!

Zur Installation lesen Sie bitte die README Dateien (bzw. intall) und
die HTML Documentation.
Weitere Anleitungen und FAQ's koennen Sie der Delta Labs Homepage und
der Revolution entnehmen.

Updates sind auf dieser CD leider nicht moeglich, da sie aus technischen
Gruenden nur als single Session nutzbar ist.

Bitte beachten Sie, dass sich im HTML Ordner viele nuetzliche Dateien befinden,
u.a. auch eine Debian-Linux-User-Guide.
Es gibt auch diverse Mailinglisten zu Linux; Linux/68k; Debian; RedHat usw. -
technische Fragen sind dort am besten aufgehoben!

Fragen an diese spezielle CD richten Sie bitte an: Delta Labs Media!
(deltalabs@usa.net; Tel.:0202-3702317; Fax:
0202-3702319; Osterfelderstrasse 16; 42103 Wuppertal)

Leider passte aus Platzgruenden der Sourcebereich nicht mehr auf diese CD,
er wird aber in aktualisierter Form demnaechst ebenfalls als CD bei Delta Labs
erhaeltlich sein, bitte schauen Sie auf der Homepage von delta labs media nach!
http://www.deltalabs.com
Dafuer ist aber KDE in der neuesten beta-3 enthalten, ebenso die neuesten
Entwickler
und User-Kernel, so dass fuer jeden etwas dabei sein sollte.

Viel Spass mit Linux!

29.3.98

Newsgroups: comp.sys.atari.st.tech

I have a link 97 connected to a 1040STf which is connected to a SyQuest EZ-Flyer 230 external SCSI and it works great. I would like to add an external Chinon CD-ROM (CDS431) but cannot get the driver (HDDriver 7) to recognize it. It will not install the partition for it.

I think its related to the fact that the auto-config will not find the drive, however the ID Check will see the drive (at the correct SCSI address). I have the SyQyest at SCSI 0 and the Chinon at 6 and the Link97 is of course 7.

I placed a DB25 out from the SyQuest which mates to the Chinon Centronics (50 pin) (this was a "Macintosh" cable). I also have the correct terminator on the Chinon. I have tried reversing the chain order, but to no avail.

Any help / ideas? What should the sector size be for a CD? BTW I am running TOS 1.4.

Thx!
Wade

You should only need one host adapter for up to 6 drives. Provided of course you can find a cable that has that many connectors, and a power supply with enough power leads, and a case with enough empty banks to screw them to....

With two separate cases, it would require that your dma cable go out from one host adapter and into the 'in' port of the next one. Then go out from that one to the Atari. You would be better off installing all into one case, and save that extra host adapter for when you need it in the future. Btw, what size are your harddrives, and what version of TOS are you using? Is this a major MIDI project where you need tons of space?

Are you sure the Atari boxes don't have sync problems then ? In our config,
we used 19200 and 38400, and the transfer rates were a little less (due to
protocol overhead). BTW, do Sting and/or your pppd support PPP compression ?

Greetz,

You need additional driver software for CD-ROM. Try Extendos or SPIN.
SPIN will use the new generic SCSI i/f in HDDriver v7.

Hi,

in the very-near-future I should have a PC. This sounds like a fine opportunity to backup my Mint System. Now, my idea is to use Linux on the PC with NFS to make a filesystem (on the PC), which should be visible to the Atari. This way I could create a tar on the PC with my entire Mint filesystem (I have not enough space on the atari to create the tar there). Does anyone have experience with such a set-up, either Linux or Mint ?

This seems a better solution to me than copying all files by ftp to the PC. I should also mention that my experience with NFS is rather limited.

Thanks in advance,

```

Tried it at 38400, slightly slower. I've had an email saying it could be the
problem with Stings TCP module that is quite common. Thanks to whoever that
was.

As for the compression Sting supports VJ compression, as does my pppd (which
also supports BSD compression)

 Strange. Anyway, I never tried it with Sting, but with I-Connect. It then
 had no abnormal transfer rates. But I thought Sting was slightly better
 (performance) than I-Connect.

: As for the compression Sting supports VJ compression, as does my pppd (which
: also supports BSD compression)

 Nice, pppd under Mint still doesn't support BSD compression. But my links
 used SLIP, so not much compression there...

 Greetings,

I've done this with an STFM and a PC running Win95.

Linux should work fine also, and should be even easier to set up.

You will need to set up a serial connection (PPP), then you can dial in from the PC. Run NFS on the Atari and set up your exports.

I sent a 'how to file' to Hallvard, he very kindly edited it and put it on his site.

Here is the address:

<http://home.sn.no/~hallvart/>

On a standard STFM, 19200 is the fastest speed available, but NFS is still usable even at that low speed. Great for backups.

hai,

i just read the thread on 'an remote file system for mint' and suddenly the coin dropped: that's what i need, only slightly different :-)

the problem is, at home i have a falcon running KGMD-MiNT and my kids have st's with small harddisks and i have to backup those discs!
now i'm wondering isn't it possible to 'mount' their drives on my machine so i can perform backups and so? and more importantly *how*?

bye, carel

Okay after a year of problems w/my floppy drive. It was a bad cable after all. (I had tested the cable w/ another bad cable so I hadn't noticed :( ) I finally had a fully working Atari Mega STE!

Then 20 minutes later after reassembeling the machine I noticed the hardrive did not show up on the desktop.

It looks like the asci card may have been plugged in incorrectly and I reseated it to make sure it was okay.

When I boot off of the floppy with teh ahdi driver disk it does not see the hard disk. Though some times when I boot I get a AHDI error message saying that the disk is "not boot loaded".

The error message led me to believe that it sees the drive somehow but teh drivers are not installed.

If anyone can give me any instructions on how to trouble shoot this problem better I would so much appreciate it. I know it is not the cables or that it is connected incorrectly cause I checked that a million times.

Also if I were to get the ICD scsi kit do i need to use the asci card at all?

Thanks in advance,
David Baisley

I'm not the webmaster of that site. I just doing the uploads.
Quite some time ago I asked the webmaster to give that site an alias but
for some reason he never did that.
I'll probably see him tommorow at the meeting of A4 -Belgian Atari
club- so I'll asked him again.

I known there are some problems with that site but there is nothing I can
do about it.

BTW the right address is: 193.190.205.13 atari/incoming
or if you use a browser: ftp://193.190.205.13/atar/incoming

Dont know.  I did download it and got it to work using MetaDOS 2.7.  With the
mix of drivers, my Syquest started locking up so I nixed the CD aspect (it was
s 1x anyway).  I just wanted it for transferring data from the PC to the ST
(archiving).

Nope, no info from me. I tried to contact the company several times, but
finally gave up. I also tried system solutions to no avial. Now I'm running
a Falcon w/ a Nova, which I guess was my final solution.

At least you have NVDI. I was stuck using the cruddy beta version drivers
that came with it. They always caused CAB to crash.

To have an icon appear on the desktop, you have to select the Install Icon
option from the desktop. This is absolutely independant to whether there is
effectively a drive installed or not.

>It looks like the asci card may have been plugged in incorrectly and I
>reseated it to make sure it was okay.

Try running The HDX utility from the AHDI disk to install a boot sector, or even repartition. Maybe your drive is dead after all...

Hello (esp. Terry)!

Please excuse my late reaction.

Unfortunately the last message in th thread this postings belongs to has disappeared in my mail reader, so I start a new one...

Here are the requested pinouts of the serial 1 and 2 ports on the mainboard of the ATARI TT.
Note that Serial 1 is not a complete serial port, but only capable to be used for nullmodem transmissions (no modem).

Pin	Serial 1	Serial 2
1	-	DCD
2	-	DSR
3	RxD	RxD
4	RTS *	RTS
5	TxD	TxD
6	-	CTS
7	DTR *	DTR
8	-	SYNCLKI
9	GND	GND
10	-	SYNC OUT / n.c.

* means: only constant high voltage

Hope this helps,
Carsten

C|NET Central did an article about 30 years of Windows and make several references to Atari, the 8-bit OS and the ST's using GEM. Here's the link:

http://www.cnet.com/Content/Features/Special/30Years/index.html?dd.sd

d> When I boot off of the floppy with teh ahdi driver disk it does not see
d> the hard disk. Though some times when I boot I get a AHDI error message
d> saying that the disk is "not boot loaded".

My first thought was that maybe you zapped the bootsector of the Hard drive.

d> Also if I were to get the ICD scsi kit do i need to use the asci card
d> at all?

My personal recomendation based on experience would be to get the link 96, a
SCSI 2 internal adaptor that allows you to mount an external socket on the
MEGA to take SCSI 2 to the outside world and a chain of 6 extra devices.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

Why don't you use SLIP ? It's much easier to set up if you have access to
both machines. PPP works too though, if you insist.

Cheers Peter

What are the options available to TT030 owners nowadays? I currently
have 8MB of ST-RAM and no TT-RAM.

Hi Carel,

You were right, the site was down Sunday night. But I'm really supprised
you couldn't get in yesterday. But you're not the only one who has
difficulties. Other ppl also have troubles. Normally it should be fully
opperational again.
Sorry for the inconveniences.

No.

Now for another question: I have an old Hitachi colour monitor which I suspect may be CGA (it has a nine-pin socket, and doesn't seem to like VGA signals). Can I use *that* with an ST? (I seem to recall that the ST video specs were somehow CGA-like).

Yesterday 29/06/98 at 18:00 CET I could reach that site without any probe.
Anyway I think lynx-2.8 can be found on:
ftp.funet.fi/pub/atari/piwo-mint/Netapps

He Karl,

Back to earth I see. Where was you sunday morning? I was expecting you at the
club meeting.

Yesterday 29/06/98 at 18:00 CET the site was reachable as I could do some
uploads.

I guess we all agree: Atari could have been a contender, but it suffered
through several managements that just didn't manage. It's no sadder today
than when you and I first discussed it; in fact, I think the situation is
even brighter today than six months ago because of what I see in this ng,
on the mailing lists, in FidoNet, and from users in general.

As long as you've got a DMA lead betwe the two cases it ought to work fine
with the provisos you've stated.

Hi:

I'm looking for an Atari Jaguar Flash ROM cartridge. If you have one
available, please e-mail me at KevinManne@wycol.com with your price.

Thanks,
-Kevin

That article has no credibility.
Whilst it's fair to include the Atari they totally ignored the Amiga
achievements. The first multitasking GUI on a home computer surely deserves
a mention, doesn't it?

All,
     Speaking of the Amiga, Gateway has announced that they are working on a
new Amiga computer. OS 4 will be a tempory OS for software companies to
build apps then when the new machine hits the streets next year, it will
have OS5. They said that this machine will be better than any consumer
PC available.

I have three of these drives in boxes...power supply and cables to one,
cables only for others...good for chaining.  Don't think they've ever been
used.  I'll sell all for $25 plus shipping.

Gateway actually haven't announced anything (AFAIK) but Amiga International
have released those details. They do have full support from Gateway
however, including substantional financial support.

PPC has been dropped in favour of an as yet unavailable CPU/Processor which supposedly will feature a programmable instruction set.
The new system due in 1999 will be 5-10 times faster then current PII 400Mhz/100Mhz bus systems.
OS 5.0 will be the OS running on this system, with the developer OS 4.0 and machine (Amiga/PC hybrid) released later this year to allow developers time to develop applications for the new system and to have them ready when the new machine is officially released.

Current PPC upgrades will continue to be sold and supported with the manufacturers of these boards (finally) working together to support the Amiga community until the new machine is available.
The OS 3.5 upgrade has been cancelled by AI.

With Gateways backing the Amiga could once again be a viable platform.
Besides, we must be due for another platform to kick the shit out of the current Mac and PC systems. How stale can it get ?.

Regards,

Clockmeister.

No such thing as a 'colour' SM124 - this is the mono monitor. It's probably the most desirable item of the pair.

$50 the lot, I would reckon.

Using the BSD-Compress alogorithm to compress the packets. (ie LZW
compression)

8 megs of ST RAM? And no TT RAM?

I thought the only legal values for ST RAM on the TT were 2, 4, and 10 (2+0, 2+2, 2+8) megs.

A standard 8 meg TT has four megs of ST RAM (two banks of two megs) and 4 megs of TT RAM.

If your TT really has eight megs of ST RAM, then it must have a third party ST RAM board.

(I use the MegTT board from System Solutions, with 16 Mbytes. The board itself can take from 4 to 128 Mbytes of TT [fast] RAM using 30 pin SIMMs)

Yes, but only if the the system is open and if people are eventually able to build one themselves from modular components as well as use industry standard cases, video cards, etc. etc. I don't care WHAT cool things they put in it if it is going to be another eighties style closed up box that can only be minimally upgraded with manufacturer supplied parts.

Apple will yet die of this disease. We don't need another carrier of it.

Some employees at my local electric utility recently shut off the wrong transformer, blacking out a large portion of my state. My wife was online at the time and didn't secure power to the system.

When I came home, drive C: was trashed (naturally, my backups wouldn't restore), and my Nova card was fried. After not having any luck getting the Nova to respond, I decided to just remove and store it for possible repair, and attempted to reinstall the Serial 1 & 2 ports that the previous owner of this TT removed when he installed the Nova card. I went to a local used computer store and purchased a used PC I/O board, so I could use the cables/ports attached to it, rather than building my own from scratch (I bought the TT used, and have next to no documentation on it). I've had no luck communicating with my modem, however. So, a few questions:

1. Should I use a custom built cable? Or will the PC cables work?
2. Are the Serial Ports and the VME bus interrelated in any way? Rather than thinking that I have a problem with both my Nova card and my ports, should I be looking for a problem on the motherboard? (Nothing else seems to be misbehaving).
3. If it's likely to be a problem with the Nova and/or ET4000, can

anyone recommend a decent service facility (I live in Maine, USA).

Thanks in adavance,

Terry

I have download your file sony_144.zip before to buy my floppy, it help me very much to make the modification on CTIN and HDIN, the solution i have found today is to put my old floppy on drive A and the new Sony on drive B, it works, i'haven't make the HD modification because i'm waiting for the crystal oscillator. Last week.
Still, thanks for your document of the adaptation.
Good bye and may be on fr.comp.sys.atari ;-)

Don't forget : Atari the alternative power without the price

I'm about to acquire a TT030, and I've got some learning to do in the area of

- those darn serial ports. Which ones can be used for what?
- serial mice, incl. 3-button jobs and which darn serial port again.

Can anyone point me at some info? I may be using any and all of TOS,
MiNT, STiNG.

TIA

Another possibility: When this message appears after having started a program file, it most probably means that this program file is damaged. Try to get/unpack/install/download it again.

So long,
Carsten

Caution: Even netween PCs you cannot always interchange the serial port cable adaptors! But I can mail you the pin layouts of the ATARIs board pin arrays to verify this.

>   2. Are the Serial Ports and the VME bus interrelated in any way?

No, they are not. The VME bus consists mainly of a set of cables and a few signals in addition. I don't think there can be a damage that concerns only "the VME bus".
I would rather think your graphic card has blown...

Good luck,
Carsten

Most of this is already answered on my homepage:

```
     Modem-1:  tops at 19200, like an ST;
               limited use, but okay for local nullmodem connection.

     Modem-2:  standard max is 38400, very good for modern modems;
               this is the one you should use for your new 56k.

    Serial-1:  tops at 19200 and only has basic send/receive pins;
               perfect for serial mouse.

    Serial-2:  tops at 230400, but lacks RING DETECT pin;
```

not quite right for modems, but great with ISDN adapters.

LAN: (same port as Serial-2, selected by default upon bootup)

Other TT questions are answered in my FAQ. URL is below.

The falcon doesn't : the 030 is interfaced to all componants via a
68000-like bus.
(/CBREQ is not even wired)

Is the "synchronous transfer mode" (/STERM) supported then?

AFAIK these two options, Burst mode and Synchronous transfers are rather
important for the cache on the 030 chip to give its best performance. They
would also reduce the bandwidth used on the bus.

But accelerators such as Afterburner and PAK does use these modes atleast
for transfers to/from TT-ram, or ???

I'm afraid that the falcon's 030's cache is done on the worst way : single entry mode, asynchronouly.

/STERM is not wired either, as it needs a 32 bits data bus to work safely. (falcon is 16bits)

I agree with you :_That's_ a pity.

To good that they didn't skip that signal to.

> /STERM is not wired either, as it needs a 32 bits data bus to work
safely. (

> falcon is 16bits)
One gets the feeling that they started with a 1040 motherboard when they
designed the Falcon instead of an all new design. Concider this and the
Falcon are preforming pretty well after all...

But woudn't it be possible to wire the signals required for
Burst/Synchronous mode to a TT-ram board? (hint! hint! for anyone wokning
with such cards..).

> I agree with you :_That's_ a pity.

Let's hope that the Milan and Phenix machines will use those features in
the 040/060 chips.

But does anyone know what the TT030 does with those signals? Synchronous
and Burst modes??

And a very useful resource it is. Unfortunately Netscape doesn't seem
to interpret your <TH>s correctly, with disastrous results:

```
                 TT030 MEGA/STE
          CPU 68030 @ 32 MHz 68000 @ 16 MHz
-------------------------------------------------
                 Bus 32-bit data;
```

```
       32-bit address 16-bit external; 32-bit internal;
                  24-bit address
```

It's probably OK in Lynx though. :)

>   Modem-1: tops at 19200, like an ST;
>   limited use, but okay for local nullmodem connection.

Should be fine for a null modem link to my STe.

>   Modem-2: standard max is 38400, very good for modern modems;
>   this is the one you should use for your new 56k.

A 38400 port for a 56k modem??? But I have a 19k2 Zyxel modem for which
this would be a good match (mainly for incoming analog fax: this one has
Ring Indicator etc., right?)

>   Serial-1: tops at 19200 and only has basic send/receive pins;
>   perfect for serial mouse.

Serial mouse it is, then.

>   Serial-2: tops at 230400, but lacks RING DETECT pin;
>   not quite right for modems, but great with ISDN adapters.

Except I plan on connecting to ISDN via a router and a Riebl ethernet card. :)
But that would be a great null-modem link for a Falcon. :)

>   LAN: (same port as Serial-2, selected by default upon bootup)

So I guess some kind of little AUTO prog is needed to switch to Serial-2?

As you can see, I'm planning to use the TT as a kind of serial-port hub.
Hopefully dual-booting between TOS (for Calamus and MIDI stuff) and NetBSD.
(The TT seems to be quite a popular platform for NetBSD/68k, so Atari's
dream of a Unix workstation has come true in the end).

I'm sure someone will give you a more comprehensive answer but I
experienced this confusion when I got this TT.

The fact is that serial standards for the higher speeds were not well
defined when Atari were designing the TT so they took an educated
guess.

Modem 2 and Serial 1 have some wierd high speeds. Modem 1 and Serial 2
are OK. I am using Serial 2 at 115k2 DTE to drive a 28k8 modem via
HSMODEM v7 and STiNG v1.15. No probs.

The 'funny' ports can be modified but I guess it would be best to use
them for slow devices like mice unless you have a whole host of serial
stuff needing high speed.

Can anyone help me out with a STFM MMU and Video Shifter IC.

It would be great if anyone has I bust ST where I can buy cheaply these 2
IC's.

Please mail me if you can supply me with them.

(pref. in the UK)

Thanks Carsten - the pinouts would be appreciated if they're readily available - if not, I can just check around some of the web or ftp sites and see if I can find them.

Hi

I picked up a Compatibilty+ board and TOS ROM's 2.06
to install into my Mega ST2 so I could add the
Marpet Xtra RAM 8Mb card.

I desoldered my CPU and removed the TOS 1.2 ROM's (there were 2 chips)
then soldered in the Compatibility+ board with 2.06 ROMS.

I didn't put the 1.2 ROM's back in to keep things simple (I was going to add
them later)

Q: do I still need to connect green wire to pin 20 of old ROM socket if I'm
not going to have both TOS versions.

I put the Mega back together, turned it on... nothing, the floppy light
doesn't come on, monitor flashes when
I turn the machine on but that's it, dead, kaput.

I haven't added the xtra ram card yet, I thought I would test the Mega after
each stage of
the upgrade.

I used a ground strap while working on the mother board, checked for joined
traces, cold joints
everything looks fine.

If someone who has installed this board before could help with some
troubleshooting tips
I would really appreciate that.

Charlie Wood

there are 2 modem ports (on up to 38400 and the other to 19200), two serial ports (9-pins) for null-modem connexions and alike.

i don't understand the second question

Thought some might be interested in this. Maybe if there were enough request, ATI might consider offering some cards for sale.

Hi,

Thank you for your email. Right now, the Graphics Pro Turbo ISA graphics cards traded-in are very low in quantity. Anyway, we have forwarded your email to our management for review. We shall let you know if they are interested in selling these cards.

Yours truly,
ATI tradeup team

sounds interesting. is the graphics card adapter and software you
mentioned still available? i read about the panther2 ISA-adaptor a few
days ago, maybe even this one works with the software and ATI card...

Wrong ol wise on. Them there jumper to the right front of the memory HAS NOTHING to do with the amopunt of memory that is being used. By the way by turning on switch number 7 all you have accomplished is to tell TOS that you have a high Density floppie installed. Nothing more nothing less. Matter in fact even doing this may not let you use a 1.44 drive as the WD1772 FDC was never designed to a high density drive peroid. Yes it may work for some, but for the majority it DOES NOT WORK. that is my two bits worth.

It could be too that you have gotten a Mega that has a MMU in it that can only see 1 meg of memory. There are no additional jumpers that must be set in order to see more than a meg of memory. Check your MMU part number it should be either C100109 or C110353 if it isn't one of these you should toos it out and replace it. They run about $35.00 from Best Electronics (408)243-6950

Hi!

  Some years ago had "Elektor" a project with a PAL programmer that one
connected to the paralell port of a PC, it was a very simple construction
with a set of shift registers and some flip/flops. Is there anything like
that for the ST?

Regards..

You mean 'the brick'?

1	+5v
2	not connected
3	GND
4	+12v
5	-12V
6	+5v
7	GND

+5v at 3Amp
+12v at 0.03 Amp
-12v at 0.03 Amp

The dual lines for GND and +5v are common - they are just there to ensure sufficient current carrying capacity.

As far as I can remember the -12v is NOT used.

I think you should forget building your own. Get a second-hand 200W PC power supply and just rig the connectors. They are very cheap from computer fairs or PC repairers. It will provide enough power to fire the ST and a few SCSI devices if you require.

I bought an old PC case with integral PSU and have used this to house the floppy and SCSI kit and power everything bar the monitor.

Hi folks!

Since the TT has a 32-bit databus, wouldn't it be possible to fit a 040 without too much hassle? The Afterburner consists mainly of a 040, some controller-logic for the fastRAM and some logic to allow the 040 to access the 16-bit Falcon-bus.

The TT is AFAIK 32-bit all the way, which should eliminate the need for the bus-sizing logic, and fastRAM is already present so there's no need to worry about that either.

Hello there!

Crown of Creation 3D, the ultimate space-action simulation for the Falcon030, finally got its own homepage!

After the overwhelmingly positive reactions of many players and magazines, now the latest facts on this standard-setting game can be accessed via internet.

Simply go to http://www.tu-bs.de/~y0001569 to see this:

- The story
- The features
- Test reports
- CPU-/DSP speeder support
- Online order CoC 3D
- Get the latest updates (V1.3b)
- Screenshots

All pages in Deutsch/English.

See you soon!

I'm trying to connect my falcon to my linux box via a null modem cable. I've set Modem 2 to active under sting and run pppd on the linux box.

Packets are transfered but the linux box is dropping any packets that sting sends. Because of this the ppp negotiation is not performed and I can't connect the machines.

Has anyone got experience of a similar setup?

David

I might have killed my existing Mega 2 board installing
a compatibility plus II and TOS ROMS 2.06

So I'm looking for another Mega motherboard with minimium 2Mb's
I'll take a complete box if the price is right. I don't need monitor, mouse,
keyboard etc.

My postal code is V8V 1J6 so please give the price of the board +
mailing/shipping cost

TIA

Dave, you are absolutely right. I talked with another Atarian two days ago, and he likewise brought out that the dip switches didn't affect his RAM upgrade. And as I read your reply, I *actually* do remember setting that jumper to allow my HD floppy to be read properly. Thanks for catching my error. Hopefully I didn't mislead anyone else in the group.

RAM-wise, it does seem that you don't have to make any changes to get more RAM, as long as you are upgrading to 4 megs. If his system came with 4 256k Simms, he should have been able to swap them with four 1 meg Simms. Perhaps they didn't seat properly.
Marc

David Moore wrote:

> Wrong ol wise on. Them there jumper to the right front of the memory HAS NOTHING to do with the amopunt of memory that is being used. By the way by turning on switch number 7 all you have accomplished is to tell TOS that you have a high Density floppie installed. Nothing more nothing less. Matter in fact even doing this may not let you use a 1.44 drive as the WD1772 FDC was never designed to a high density drive peroid. Yes it may work for some, but for the majority it DOES NOT WORK. that is my two bits worth.

Hi to all,
first of all I would thank everyone here for the interest shown in my
humble Atari page, "The ST Hardware Hack Page".
A lot of people mail me asking more and more hacks!!!

Help me... have you got something very, very smart?

I'm looking for: (for example!)
- SCSI controller schematics
- a interface to use a PC keyboard on ST
- an accelerator with cache? Why not!
- anything!

Bye and thanks in advice.

Ciao

The graphics adapter is produced by Computerinsel in Germany. You
would have to contact them to see if any are available. I think the
Panther is still sold by System Solutions. The NOVA drivers are
specific to TT and Falcon (and clone) machines, but I do remember
seeing an ATI version of the Panther (for ST's) I thought on the old
SS web site.

Hi!

The GLUE chip maps the first bytes of the old ROMs (FC0000..FC0007) to address 0. If your board doesn't do the same for the new ROMs (starting at E00000), the CPU isn't able to load the initial program counter and therefore the operating system can't be executed. The effects you described look like that.
Pin 20 basically is the ROM select signal from the GLUE chip. Probably this is needed to do the mapping, so you would have to connect the green wire.

Joerg

On the TT they are available to the fastram card, so it's up to the card to do it right. STram access is non-burst non-sychronous.

Unfortunately in most of the newer TTs the PLCC-68030 is soldered directly
on the mainboard (e.g. in mine, assembled in 1992).
This could make it very difficult to replace it by another one...

I've just installed a aixTT fastRAM-card with 32MB EDO, do you know if
this configuration supports burst-mode? The aixTT "documentation"
doesn't mention this.

I run my BBS on a 4Mb, TOS 4.04 Falcon, standard apart from PowerUp2 that was fitted when I bought it, and I have two SCSI hard drives in an external case. One is a Conner 1.1Gb and the other is a Seagate/Imprimis 330Mb. Both have run fine for several years now but, last week, I found that the Imprimis was giving read/write error messages (Data on Drive ? May Be Damaged) for all partitions. I had not changed anything for a considerable time so I initially assumed that the Imprimis had failed.

I have a SyQuest EZ-Flyer and because all of the data on the Imprimis would fit onto a cartridge I decided to try and rejig things so that the Flyer replaced the Imprimis. I added the Flyer in place of the passive terminator (it's internally terminated) and the Imprimis worked again. And it continued to work for over a week without any repeat of the problem......

I assumed that it was a fault in the terminator and left the SyQuest terminating the bus until I obtained a new, passive terminator. Using this brought back the same problems as before, although this time I did lose some data. Putting the SyQuest back on again has it all running fine once more.

I'm rather baffled as to what to do next. Does anyone have any suggestions? Is it the Falcon, the Imprimis drive or something else? Would an active terminator be any better?

Keith

Liquidating some of the toys I have....SF354 floppy drives LN. One drive is complete with cables and power supply, the other just drive. Both are in original containers. These are easy to daisychain. If nothing else these make a good backup. I'll ship anywhere USA for $35 (prepaid).

Yes, you are right.

It seems that this mod was a little too much for my old
main board. I put the old roms and just the cpu back in
and I got the same result.

I double checked the connections and solder work and
it is fine, no bridging, no broken traces. I took the
usual static precautions, wore a ground strap while
working on it.

Maybe it was just old age ;-)

I'm going to order a new main board and try again.

Thanks for your help

Charlie

i diddn't understand what was ment at first
yes diamond edge 2 will do this ,plenty of options like
repartition and rebuild,change boot sector ect

i am not sure if the latest hd driver will do this also

Hello !

Thanks for your reply ; I love your NoSTalgia emulator ; great work !

There IS a program to (supposedly) convert .ST files to .MSA, and it's being posted next to your NoSTalgia as a companion program on many Atari sites : it's called DUST...

The problem is, it doesn't work as advertised, in my experience, although your emulator does... Very disappointing, as I have your emulator, (which I intend to pay the shareware fees for, BTW,) :-)..., BUT have no way of converting any of the cool games for the ST to use on it !! What a drag !

So yes, it would be wonderful to have a converter that actually works to use with your marvelous program... It's a shame to have NoSTalgia, and not really be able to use it with anything.... Do you have any suggestions for me ?

Thanks, and I look forward to your next upgrade !

Dear Internet player:

I got some questions for you, which is about Interactive video technology.

Can you:

1.Describe a range of application areas for interactive video technology.

2.Specified the hardware and software requirements for interactive video components, and related computer equipment.

3. Describe the functional capabilities of different interactive video computer systems.

4.Select and install interactive video components and related software to computer systems.

This is a survey from one of the large hardware company in USA. test you skill you may get a job in USA. good luck.

Kind Regards
Tony CHANDER.

I would like to know where to find a DOS/Windows program that copies contents of ST formatted disk onto a PC (something like C:\> ST_COPY A:*.SYX C:\ATARI).

I tried unsuccessfully to use the pc floppy drive under Pacifist but it does not seems to work (I'll try with the floppy unprotected tonight though).

Any help would be appreciated. Please reply by email privately.

Y> meg SCSI Connor CP3540 hard drive today and wanted to add it to my

Two things.

1) Termination. Only the last drive in the chain should have termination -look for two plug-in resistor packs near the 50W plug on the back of the drive's PCB.

2) Parity. You new drive may have parity enabled - if you don't have an ICD Link 2 then it won't work with this set. You might be able to set parity to off with a jumper (perhaps labelled EP), or it might have to be done via software (don't know how you do this with an ST).

HTH.

Speak to 'ya later!

I don't know if this question has been asked already
(at least I didn't find it in the FAQ or via DejaNews):

I'm now trying to connect a Seagate ST1480N to my ATARI Mega 2.

At the moment all my files are on a Megafile 30 and a Megafile 60 harddisk.
Since I have a 2nd ATARI (a 1040STF) I thought that I can link the
ST1480N to the 1040, the 30-60Megafiles to the Mega2 and then "misuse"
the RS232 to link them both and make a "backup":

Mega2+Megafile 60,30 -> 1040+ST1480N

Afterwards I would like to reformat the Megafile 30 & 60 and
finalize the system like:

```
Mega2 -> (via AdSCSI ST) -> ST1480N
             |
             |--->--------> Megafile 60 -> Megafile 30
```

so that ST1480N is my boot disk and the Megafiles are just 2 additional
partitions.
Is this technically feasible?

Are there any good programs for making backups like

C:/Dirx/* -> C:/Dirx/*
D:/*/* -> D:/*/*
...

via RS232 ?
(yes I know, this might take long but I don't mind if this runs
during the night)

So that (assuming there are the same partitions on the Seagate)
at the end the paths of the files are the same.

I just want to avoid moving diskettes back and forth...

Thanks in advance
ME

it's fun, cause i'm looking for a detailed documentations about the ZIP
format too. But, i expect
informations which talk about the long filenames stored into a ZIP.

if anyone have got anythings....please ask us !!

Hi!

I don't use NoSTalgia, but I can offer you some program which runs on ST platform. You can download it from my page (JAY Software).

It is well known MSA archiver and the new version knows how to handle ST files too. It allows the directory listing and many more features.

regards

Stan

Alternative Computing in Burbank, and that other place in Cerritos no longer do Atari. The closest I know of is ATY in San Jose. He's very reasonable, and I plan to have him install a Nemesis in my Falcon in the near future (when I can get my hands on one).

If you're interested in contacting him, drop me some e-mail (remove the spam block), and I'll dig up his info for you.

Yes depending on what platform you are using. For the PC: PaCifiST, MagiCPC, for the Mac: NoSTalgia, MagiCMac, for Unix: STonX...

> How accurate is it?

"accurate" isn't quite the correct term, I'd rather say compatible. PaCifiST is an ST emulator, therefore it is compatible with most ST games and demos, but lacks the nice resolutions you would get on a TT or a Falcon and that would be useful for modern software.

> How do I get my ST's ROMs onto the PC?

With a program that included with PaCifiST.

> Can my PC read/create ST disks? If not...

Theoretically, the plain TOS disk format is compatible with DOS and vice versa. In practice you'll find that the ST can usually read/write DOS disks whereas the other way round doesn't always work. The ST must have a double sided drive, and this excludes all those extended format disks, and copy protected games.

> Is there any software available that I can use to read/create ST disks
> on my PC?

You need MakeDisk to make disk images for those tricky disks.

> Would I be able to use something like 22Disk to read ST disks?

Don't know what 22Disk is, but I guess I've answer either above or in the Quick FAQ.

> Are these questions borning?

Yes, since they are RFAQs (REALLY Frequently Asked Questions), and therefore are in the Quick FAQ...

> What time is it?

4:25 pm where I live...

> Why?

Well, the answer to this question might be a little off topic for the st.tech group...

Cheers,
Nick

A C64 can simply be connected to the Atari via a serial line. For about 20 DM you can turn the C64's userport into a RS232 interface. More than 4800 baud is not possible, the C64 is too slow form more.

Hello,

I was wondering if some kinds souls out there could possibly open up their Toad Stealth cases (black sleek styled case with green lettering) and give me a description of the inside. Information I need is the connectors used, and what all is on the power circuit board where the power supply connects. Also any other wires besides the SCSI cable would be helpful (power switch, LEDs, and SCSI ID selectors).

I have about 70 sets of these cases, and the blank circuit boards without instructions, and I was hoping to start selling them to the ST community as a do it yourself kit with some type of instructions for $20 to $40 with most parts, but I don't have a unit that is totally together.

Thanks!

*********************************
*    PHENIX 040� Workstation    *
*      FIXED FEATURES V.1.0  <-- YEAH !! *
*********************************
```

� MAY 1998, CENTEK

This computer is NOT a TOS clone or a PC compatible !
It is a NEW computer including NEW HARDWARE and NEW OPERATING SYSTEM named DOLMEN�.
A software EMULATION support into the system allows to run softwares from the old operating system named TOS�.

- MOTOROLA� MC68040� at 40 MHz (BCLK).
  NOTE : The 040 instruction execution units are CLOCKED by the BCLK and NOT the PCLK (80 MHz) - See Section 10 page 10-4 of the MC68040� DATABOOK (M68040UM/AD Rev.1) and our technical files on this site !
  By example : - Afterburner� is a 040 at 32 MHz !
  - Hades� 040 is a 040 at 32 MHz !
  - Milan� 040 is a 040 at 25 or 33 MHz.

  People who present the 040 as a x2 (i.e 64 MHz) clocked processor are liars !!!
  CENTEK refuses to use the same 'commercial' politic !

  - Can be updated with a 060 at 80 MHz (BUS at 40 MHz).

- BUS : 32-Bit DATA / 32-Bit ADDRESS / 40 MHz Frequency.

- Three SIMM sockets : 32-Bit RAM up to 192 MB.

- MOTOROLA DSP 56301� at 80 MHz (80 MIPS !).
  - 24-Bit HOST port with 3 clock cycles access :
    80 MB/s DMA transfert (or 26 MWords (DSP 24-Bit words).
  - On-Chip Memories : - 2048 * 24-Bit X Data RAM.
    - 2048 * 24-Bit Y Data RAM.
    - 3072 * 24-Bit Program RAM.
    - 1024 * 24-Bit Instruction CACHE.
    - 192 * 24-Bit Bootstrap ROM.
  - Off-Chip Memories : 384 kB 15ns SRAM (=128 kWords 24-Bit).
  - External DSP connector (Falcon signal upward compatible).
    - HD SUB-D 44 pins.

- MOTOROLA MC68360 - QUICC� at 40 MHz.

(QUICC� : QUad Integrated Communications Controller).

  - CPU 32 Core (68030) - 7.2 MIPS at 40 MHz.
  - 32-Bit DATA and ADDRESS lines.
  - Four General-Purpose 16-Bit Timers.
  - Sixteen 16-Bit software Timers.
  - Two Independent DMA (IDMA) with Single Address Mode
    (up to 80 MB/s at 40 MHz per DMA channel).
  - Communications RISC Processor (35 MIPS @ 40 MHz) with 14 DMA
    channels :
    - Ethernet/IEEE 802.3 Optional (Full 10-Mbps Support).
      - A motherboard slot is dedicated for this option.
      - 32-Bit DMA transfert.
    - RS-422/GeoPort� up to 4 Mbit/s full duplex.
      - Mini-DIN 9 connector.
      - LocalTalk� and AppleTalk� backwardly compatible.
      - 6 kV ESD protection.
      - 32-Bit DMA transfert.
    - RS-232 up to 1 Mbit/s.
      - Standart SUB-D9 conector.
      - 15 kV ESD protection (European standart).
      - 32-Bit DMA transfert.
    - Full CENTRONICS� IEEE 1284 parallel port.
      - Up to 4 Mbit/s half duplex.
      - 32-Bit DMA transfert.
    - TWO MIDI (In/Out/Thru) channel.
      - DIN-5 standart connectors.
      - 32-Bit DMA transfert.
    - One SPI� channel.
      - The 3 pins are on the DSP connector.
      - 32-Bit DMA transfert.

- THREE 8-Bit ADC channels for external DATA acquisition.
  - The pins are on the DSP connector.

- PCI� controller : - MASTER and SLAVE.
  - Two DMA channels (up to 132 MB/s).
  - PCI 2.1 compliant.
  - Support of the PCI 3.3v signaling.
  - Support of the I2O� new PCI messaging.
  - Two PCI slots.

- USB� controller for 2 HOST USB connectors :
  - 32-Bit DMA transfert.
  - one is used by the keyboard.
  - the second is available for all the USB peripherals...

- 128 kB FLASH Eprom containing the BIOS (SET UP/AUTOTEST/BOOT).
  The FLASH enables the software updates.

- ULTRA-SCSI bus (SCSI Controller with 16-Bit DMA) :
  - The SCSI bus maximum rate is 20 MB/s.
  - The HOST DMA maximum rate is 40 MB/s.

- VIDEO : S3 VIRGE DX with 4 MB of EDO RAM.
  - This card occupies one of the two PCI slots.

- SOUND : You can choose a card between :
  - Stereo 16-Bit 33/44.1/48 kHz :
    - 2 CINCH Inputs / 2 CINCH Outputs
    - 1 Mini-Jack for a microphone.
    - 1 PC compatible GAME port

    &
  - Professional 24-Bit 48/96 kHz Card including :
    - 8 INPUTs / 8 OUTPUTs, SPDIF�/AES�/EBU� Interface.
    - 2 others MIDI channels

- VOCAL : TI� Speech Processor for the
  Speech Recognition, Speech & Music Synthesis,
  Access Control, and Software ONLINE HELP !
  ** This feature will be fixed later **

- TIME : Timekeeping� module with 242 bytes of NVRAM (Non Volatile Ram) with RESUME mode to Wake up the PHENIX�.

- SLOTS :
  - Two PCI slots (one is used by the Graphic card).
  - One DIRECT 040 Processor slot for Hardware expansions :
    - others CPU (040/060) card.
    - PowerPC� card (to mute the softwares to ....)
    - others DSP 56301 card.
    - VME� bus.
    - Memory adding card (up to 256 new MB).
  - One AUDIO slots (it is used by the Audio card).

- KEYBOARD : USB Keyboard !!
  - This one may be a KEYTRONICS� Natural� keyboard.

- MOUSE : PS/2 mouse.
  - it is connected to the USB� keyboard.

- CASE : Standard Middle ATX 2.0 Tower.
  and CENTEK desktop case...later.

- POWER : ATX 2.0 compatible.

- OPERATING SYSTEM : DOLMEN�
  - Multi-tasking
  - 100 % 040 ASM code !
  - AES & VDI backwardly compatible.
  - The VDI uses all the 2D/3D S3 VIRGE� functions.
  - Easy to update by the Flash and the HD.

* FINAL USERS INFORMATIONS *

-> The PHENIX complete configuration includes

- MOTOROLA 040 CPU (may be updated to 060)
- LS120 Drive (120 MB disks & floppy 1.44 MB compatible)
- 16 MB 32-Bit RAM.
- S3 VIRGE DX 4MB 3D Graphic card
- One 16-Bit Audio card.
- 3.2 Go ULTRA SCSI Hard Drive.
- 24x IDE CD-ROM Drive.
- USB 105 touchs NATURAL� Keyboard.
- PS/2 mouse.
- ATX Middle Tower.

PRICE : 9990 FF (French VAT included).
1380 USD (no local taxes included).

OPTIONS :

- MULTISYNC 17' 0.26 pitch monitor : + 2690 FF
- DVD-ROM� drive : + 1700 FF

-> MOTHERBOARD ALONE (with the 040) : 4990 FF
690 USD

****
* HARDWARE & SOFTWARE DEVELOPERS INFORMATIONS *
****

COMPLETE configuration : 6490 FF TTC (including French VAT).
MOTHERBOARD ALONE (with 040) : 3290 FF TTC.

These configurations include :

- CD-ROM (AND PAPER) complete Documentation (Software and Hardware (slots)) and SYSTEM HOTLINE (Phone/E-mail) for the developers !
- CD-ROM with the developer package :
  - CENTinel� The ultimate 040/060/DSP56301/68360 debugger.
  - CENTasm� The 040/060/DSP56301 assembler.
  - CENTedit� The universal color editor.
  - FASHION� The RSC builder for DOLMEN.
  - GNUC++ 040 pack.
  - and the other things some developers will bring.

****
You'd like to become a PHENIX DEVELOPER ?
You will need a CONFIDENTIAL agreement !
Please contact us by e-mail to be registered and receive further informations !
We need you to support the PHENIX !
The list of the official developers will be given nextly
****

We know you are hundreds people waiting for the availability of
this dreaming NEW computer. This last will not be available before
the quarter 4 of 1998.

WE MAY PRESENT THE FIRST PHENIX MOTHERBOARD AT THE
NEUSS - 2 & 3 OCTOBER 98

If you want to be automatically informed, please
register you in our mail-list.

I am trying to find a solution to the year 2000 problem, intially for users of clock cartridges.
To do this I need a Forget-me-clock cartridge complete with software and a non complied source code for the software, I also need to know what language it is written in. Does anyone know where I can get these from in the U.K.?.
Kevin Dermott was kind enough to take the case of his cartriges and inform me that the chip used is a Dallas DS1215, if your reading this - thanks Kevin.
If a few other people would be kind enough to do the same and e-mail me the results it would be most useful, basically this is just to try and comfirm that the DS1215 is the only chip used.

Cheers, Stephen Moss.

Yes, I use an old Maxtor XT-1140 originally 120 MB MFM formatted, but
I have formatted it 180 MB RLL!!!
You will need CBHD in stead of HDX.

I have documentation on ZIP (and other formats), however as I am mid-way
through re-building my PC I cannot copy it off my "documentation" CDR...
email me and I'll try and send you a copy as soon as I can...

BTW, I think I found the docs on the WWW somewhere (about a year or two
ago), so try searching if you need it quickly...

Anthony

Can I damage a 2.5" Toshiba 1.3 Gig HD by trying to format it? If its
already formatted on a IBM or Mac, I just need to partition it, right?
If I screw it up on my Falcon trying to get it to work, can I put it in a
PC to test it? Its a used drive so I can't be sure its really OK.

Try reformat your Connor with HDX.PRG (latest version) from the start, there
 might be some prerecorded stuff for krosoft or Macsomething machine!

Hi Dave,

Can you tell me which link you were trying when the "it don't exist" message
occurred in Lynx? It was only last week or so I change the major pages to be
Lynx compatible (I was using Lynx View to verify them).

Thanks.

Correct me if I am wrong..... But will not a IBM power supply plug directly into the Atari TT030 motherboard and work? The connections and colors look the same....

Please Email me....

Thanks

Does Seagate ST 31200N SCSI (?) work as internal or external disk on TT ?
If yes:

- What version of HDX (or other utility) do I need to partition it ?

- What driver should I use ?

- The disk has 3 sets of jumpers:
  first set is composed of 3 jumpers named  0 1 2 (is it for SCSI address ?)

  second set has 7 jumpers without names with third jumper set.

  third set is composed of 8 jumpers named  SS DS ME WP PE TE TP TP
                      with PE and first TP set.

  What are the rigth settings for these 3 sets of jumpers ?

Thank's for your reply.

Use a Voltchecker first!!

------------DOIT_ST---------------------------------

J100 is the description of the TT power connector (!nl)

!begin_verbatim

```
Pin   Bezeichnung/Spannung
--------------------------
 1    PG (PowerGood)
 2    +5 Volt
 3    +12 Volt
 4    -12 Volt (seriell!)
 5    GND
 6    GND
 7    GND
 8    GND
 9    -5 Volt
10    +5 Volt Mainboard
11    +5 Volt Mainboard
12    +5 Volt Mainboard
```

Remove HTML-Tags.
If somthing is wrong, you blown your board!

Regards, Robert

Some older devices are damaged while format, ask toshiba first!
(www.toshiba.com) /support/

Newer devices are works well, if the device is formated, you only need
to connect and partition it. Allways the same on a MAC, Falcon or any PC Notebook.

>If I screw it up on my Falcon trying to get it to work, can I put it in a
>PC to test it? Its a used drive so I can't be sure its really OK.

If you have the right adaptor flat cable, yes.
It's a normal ide device.

Watch for the correct plugin at your falcon!

Regards, Robert

i didn't. i'm still using the original tt's power supply. the pc's one
in my big tower is unused. 2 times as big, and not quiter. there is no
need ! well of coz i don't have the switch, but who cares.

Give Brad at Best Electronics a call. He carries just about anything that
you can think of for the Atari. Best Electronics is located in San Jose,Ca.
His part number is C302434 or C302096 and they are listed in his latest
catalog for $40.00 on page 201

Hope that this helps you out

Hello,

I have bought a floppy drive Sony model MPF920-E to replace my old on my 520STe, but there is no external jumper to set the drive select to drive 0 and not to drive 1 as the boot drive. Where is it on the circuit board? Who can help me?
By advance, thanks, and excuse my bad english.

Don't forget : Atari the alternative power without the price

Newsgroups: comp.sys.atari.st.tech

Some employees at my local electric utility recently shut off the wrong transformer, blacking out a large portion of my state. My wife was online at the time and didn't secure power to the system.

When I came home, drive C: was trashed (naturally, my backups wouldn't restore), and my Nova card was fried. After not having any luck getting the Nova to respond, I decided to just remove and store it for possible repair, and attempted to reinstall the Serial 1 & 2 ports that the previous owner of this TT removed when he installed the Nova card. I went to a local used computer store and purchased a used PC I/O board, so I could use the cables/ports attached to it, rather than building my own from scratch (I bought the TT used, and have next to no documentation on it). I've had no luck communicating with my modem, however. So, a few questions:

1. Should I use a custom built cable? Or will the PC cables work?
2. Are the Serial Ports and the VME bus interrelated in any way? Rather than thinking that I have a problem with both my Nova card and my ports, should I be looking for a problem on the motherboard? (Nothing else seems to be misbehaving).
3. If it's likely to be a problem with the Nova and/or ET4000, can anyone recommend a decent service facility (I live in Maine, USA).

Thanks in adavance,

Terry

No one suggested cleaning the disk drive. And try a brand new formatted floppy,
if
possible.

Hi,

My problem involves the ordering of words on an MC68000 when attempting to read/write a 32-bit quantity. The MC68000 has a 16-bit data bus, so obviously when acessing a 32-bit quantity there will need to be 2 memory accesses. Does the low word get accessed first or the high word?

E.g. is the following code:

```
  move.l #$12345678,(A0)
```

equivalent to:

```
  move.w #$5678,0(A0)
  move.w #$1234,2(A0)
```

or is it equivalent to:

```
  move.w #$1234,2(A0)
  move.w #$5678,0(A0)
```

I bought a 520 ST cheaply from someone recently because I thought it might be a fun little project computer to have. I toyed with them when they first came out, but haven't seen or touched one in ... 13 (?) years.

My first project is to upgrade the memory. The guy I got it from also sold me his disks of Cubase for ST but when I try to run it, it says not enough memory. Rather than retaliate against him for not telling me this ahead of time, I've decided to try and fix it.

Question is: Where can I find info on tweaking/upgrading memory, OS, etc. on the web?

I've tried several searches and haven't seen anything quite right. (I have to admit that it has not been an all-encompassing quest either, but I would like to find out.)

Any and all help is greatly appreciated!

At least three of the other browsers you mention will allow you to abort
the start-up (home) page without crashing. ie. its a bug in CAB.

Hello again people,

Thanks for the tips and suggestions about my problems. I can live with the CAB one inasmuch as it just means I have to wait a few seconds longer before I can go on the Net.

But I must admit to being surprised by the news that I can't access an ftp via CAB - why put ftp links in an .HTML that is got to using CAB as in the Zetnet Support page ?

It looks like I've got lots to learn ....

Thanks again.

ABT

Jim.

With the right memory upgrade board, you can
put 4 Megabytes of RAM in a 520 ST. Check
the Atari dealers for more information:

http://www.tmisnet.com/~strads/hq/sources.html#Dealers

Can someone help me out on these items:

1. How to replace an ST mouse with a PC mouse
2. How to replace an ST floppy with a PC floppy
3. Info on replacing the drive unit in a SH204 with a larger size

My machine is a 1040ST that I bought new in '85 or '86. I have boxes of PC parts laying around, and would like to get the ST up and running again.

Thanks

That's probably some bug in this early version ? I don't really know.
It shouldn't bomb that's for sure.

Cheers Peter

This is wrong! You can tell CAB the address of your favourite FTP
client (in could even be Newsie). CAB will then start it up
automatically when you access in ftp: mode.

Cubase requires at least 1Mb with limitations (depending on the version). You really need at least 2Mb for it to run completely. 4Mb is great.

>
> Question is: Where can I find info on tweaking/upgrading memory, OS, etc.
> on the web?

First read the Quick FAQ
http://wwwperso.hol.fr/~nbales/quickfaq.htm

Then, most DIY hardware upgrades can be found here:
http://www.geocities.com/SiliconValley/Way/8016/sthard.htm

For RAM upgrades however, I suggest you get an expansion board. I don't know where you live, but there are still a few dealers that probably sell these.

Cheers,
Nick

See the Quick FAQ.

A PC serial mouse can be connected to the ST's serial port with the appropriate driver in the auto folder

> 2. How to replace an ST floppy with a PC floppy

See the Quick FAQ

There are several files that describe the hack. It's pretty easy.

> 3. Info on replacing the drive unit in a SH204 with a larger size

See the Quick FAQ.

SH drives are made up of an MFM drive and 2 boards: an ACSI/SCSI adapter and a SCSI/MFM adapter. Trash the second one and connect a SCSI drive directly. No guarantee that this will work however. You'll probably have to set a few jumpers, disable parity and generally mess around a bit. Apparently some SH204 SCSI boards can only support 20Mb too.

Somewhile ago I read somewhere on the web that Toad had some MegaSTe motherboards in stock aviable at a rather fair price. As Toad have stoped selling Atari related items I wonder where one may get hold of such a card nowadays, and how much they would cost.

Any hints? I'd rather build myself a MSTE in a tower than a Pc...

Regards..

Try the person who bought out Toad's inventory.

His e-mail address is: kws@radix.net.

Hope this helps you out.

I purchased a 4 meg upgrade kit from Toad last summer. Wasn't real hard to setup, inserting the piggy-backed ic was sorta tricky 'cause the instructions were'nt too clear, but perserverance prevailed, after the 3rd or 4th attempt, I finally figured out how to translate what they were trying to tell me in the directions.

Uses standard pc type memory.

Is there any utility that allows splitting a partition in half?

The idea is, you only loose data that is on the partition you split; you don't need to repartition the whole hard-disk and reinstall every application on every partition.

I know the DOS market has such a utility, but I would need the same for my Atari. Either a GEM/TOS program or a MiNT port of some Unix utility is perfectly fine for me.

Please Cc your reply to my e-mail, if you have a positive answer.
Thanks.

Here's the web address of Keith Scroggins who bought the remaining stock
from Toad
I just bought some items from him and he mentioned that he had some STE
motherboards
in stock.

Sounds like my Toshiba acted after installing an accelerator. I've
been told that Toshiba HD's are barely marginal at 16 MHz, and that
they don't work with accelerators.

You can use ftp, gopher with CAB if you use a proxyserver. Try to find out if your provider offers proxyservers for http, ftp and gopher. Furthermore you can also use aFTP or Newsie (not recommened IMHO) as external ftp-prog.

A TV programme on British TV the other evening showed a memory card from a digital camera being inserted into a floppy disk sized adaptor and read by the PC as though it was an ordinary floppy.

This is of obvious interest to anyone contemplating manipulating data on their Atari, so the question is does this adaptor require a software driver be installed on the PC or is it totally transparent - and has anyone actually tried one?

What sort of memory card is it, industry-standard Compact Flash?

Speak to 'ya later!

You can buy Flash-based PCMCIA cards that are also used in digital
cameras --
a company called Adtron makes a SCSI PCMCIA flash/sram card reader, the
card
looks just like a SCSI drive to the computer. (Pretty pricey, though).

Hi all. I was just wondering if there was any reasonably painless way to get the Atari to recognize a third floppy. I have a 1040 STf, w/ hard disk and 2 external floppies. It will only recognize one of them. Any way around this?

Also, does anyone know of any Public Domain demos? Not game or program demos, but demos from indiviuals/groups. I have some for my C64, but I have not found any for the ST. They usually consist of a song, with some flashy gfx, and a message from whoever made them. Anyone know what I'm talking about? Any one have any leads?

If you can help with either of these, please post here or email me at: swallow@intergate.bc.ca

Thanks!

I'm currently looking for another copy of STOS (boxed with manual) and a
copy of
the Game Maker's Manual.

I had both at one time but sold 'em when I sold the ST. I now find that I
need 'em.

Alternatively, if there's anyone in the UK who'd be willing to lend 'em to
me for a
couple of weeks then I'll refund the postage. I've started work on a
STOS-like
language for the PC and need to see how STOS banks and modules are
structured
so that I can build-in a bit of compatability.

The power of anonymity has overcame another poster. Could you imagine
someone just standing up in the middle of an Apple II user's group meeting
and just start babbling about whatever off-topic came to mind? Now, who is
sitting at home going, "I am glad that guy spammed this newsgroup, I am
going to be rich thanks to his helpful post,"?

Sincerely,
Jason Whorton

The problem is that most good news servers have filters in place which stop this trash from appearing. By replying to the post all you do is make sure that more people get the message - people who otherwise wouldn't see it.

Gareth.

Nostrodamus phrophesised this from jimsmith@zetnet.co.uk to All...

Hi James!

 j>

 j> But I must admit to being surprised by the news that I can't access
 j> an ftp via CAB - why put ftp links in an .HTML that is got to using
 j> CAB as in the Zetnet Support page ?

Grab the AFTP package as advised earlier and install it as the ftp client in the Internet clients config in CAB.

You can install Newsie as an ftp client instead if you prefer.

 j> It looks like I've got lots to learn ....

You'll get there.

Speak to 'ya later!

Martin-Eric Racine (q-funk@megacom.net) wrote:
: Is there any utility that allows splitting a partition in half?

Er, not as such, AFAIK...

: The idea is, you only loose data that is on the partition you split;
: you don't need to repartition the whole hard-disk and reinstall every
: application on every partition.

It shouldn't be _too_ hard to write... You'd just need some info on the
structure of the partition table and rootsector (can be found in the
linux-68k sources, in one of the header files).
You'd need to change the partition info in the table, the number of
clusters, FAT size, etc. in the rootsector and -if you use a FAT filesystem-
the FAT sectors themselves...

: I know the DOS market has such a utility, but I would need the same
: for my Atari.  Either a GEM/TOS program or a MiNT port of some Unix
: utility is perfectly fine for me.

The problem is that nearly every system has its own parttion table format...
(although the DOS and TOS ones are fairly similar, IIRC)

The Riebl has an AUI connector too, so a 10BaseT adapter should work.

Epson SMD-380 Floppy Drive

This is the drive in my old Atari 520ST.

Can anyone tell me about the pin outs on the back of this drive and the different jumper settings.

Thanks if you can help me out here.

Check out this link for connector pinouts

http://margo.student.utwente.nl/stefan/hwb/menu_Connector.html

The Atari floppy drive connector is exactly the same as a PC 3.5" floppy drive connector, only "upside down".

2 jumpers on the Epson should defie the drive ID number, either 0 or 1 (or 2 or 3). I'ts set to 1 for use on the ST. I don't know if there are any more jumpers.

Cheers,
Nick

Ok....I have been working on this damn thing for the last ten hours. It is three in the morning and I have given up. I purchased a 500 meg SCSI Connor CP3540 hard drive today and wanted to add it to my existing hard drive setup on my 520ST/1040ST/Mega ST. What is my current setup? I have an ICD host adapter connected to a Seagate ST157N drive. Since the Seagate drive worked, I thought.... let me try to hook the new one up in its place....didn't work, would not recognize, format, find.etc.....

Then I decided to daisy chain them. Did not work. It kept finding the Seagate drive but never could find the Conner drive. I read through the ICD Manual but I am using a newer software than the manual follows. I think the version I am using is 6.5 1994 copyright. Although I know nothing about SCSI, I do know this much:

The ST157n drive was set to "0" and the new drive was set to "1". After reading, I discovered about blister packs. Since the new drive did not have any, I moved the ST157N to drive "1" and the new drive to "0". The ICD only would read: "0" unknown device, "1" ST157N. I know it is finding something on "0" but will not do anything after that.

While I was screwing around with this thing, I messed up my original drive....it wont boot now. I think I can get this on fixed because no matter what config. I have tried, the ICD adapter always finds the Seagate HD.

Any suggestions on how to get this thing going. What am I doing wrong?

Will the Conner drive not work with my ICD adapter. I have two ICD adapters and both work great for the Seagate drive?????? Do I need to buy a different software package instead of using ICD's even though the adapter is built by ICD?

Thanks for any help.

Can't remember if it's already been suggested or not, but are you using the same cables on the PC as the Atari? Maybe one's bad.

How did you partition your hard drive?

I believe if you have ICD Pro or an ICD host, it's a simple matter of

using ICDFMT to go in and redefine your partitions. Use the setting to
only write the info for the old partition and the new one you create,
though, because you could repartition the whole drive by mistake.

I found a source that manufactures PLCC to PGA adapters. They do infact list one that would work with an 68882.

The catalog is a little dated, and I haven't verified them to still be in business. The company is:
McKenzie Technology
44370 Old Warm Springs Blvd
Fremont, Calif 94538
(415)651-2700   (note, California has gone through numerious area code changes)

Mike

I am after broken cartridges with a pass-thru port on, like the clock cartridges etc.. for an experiment.
Cheers! for now
Steve

Hello Everyone,

> 1. how do I get to an ftp site ?
> 2. why do I have to have CAB (1.5) load any .HTM on boot up

I'm still getting tips on the above - to those who have taken the time to submit these to the newsgroup and also those who have sent emails, many Thanks.
You'll no doubt be relieved to know that I think I've got my setup a bit more organised than when I started but, being me, I still need help in other areas .....

I have been trying to get a copy of PH Player from the following sites:

http://probehouse.home.ml.org
http://www.geocities.com/SiliconValley/6880/phsw.html

These are the places to get this from - according to Atari Computing Mag. Unfortunately, when I use these URLs in CAB, I'm told 'you can't go there' and 'Blocked'.

I have had this problem with ml before because I exchange mails with a guy called Toodeloo (DHS musician) who has an email address on monolith (ml) and I can only get to him via a Swipnet connection. I have submitted a request for the ml site to be re-assessed for access (and asked why it is blocked) but am still waiting for a reply.

In the meantime, can anyone tell me of another location to download PH Player ?
And please don't tell me it's on the Atari Computing Mag site because I can't get past past index #2 there !!

TIA (Am I picking up the 'lingo', or what ?)

Jim.

Instead of trying to add a third drive (which I've never heard of) did
you ever find out why the 2nd floppy doesn't work?

As for Demos, sure. We have plenty in (what's left of) our user group
library. I know they are available online, but don't know where. I'd
like to put ours up online someday.

Hi !

I'm looking for the Atari ST games Llamatron, Horror Zombies from the Crypt, and Dungeon Master.... Ideally, I'd like to find the .MSA files of them (for use on the Atari ST emulator for the Power Mac, NoSTalgia), as my attempts to convert the .ST files of Dungeon Master that I have to .MSA files via DUST, simply will not work...

Any info regarding any of this will be greatly appreciated !!

Thanks !

Hi...

Can anyone recommend a way to convert .ST files to .MSA ? (Power Macintosh
)... I tried using the latest version of DUST, but it won't work... I even
tried e-mailing the author, but heard no reply...

Any help would be appreciated !

Thanks !

If you use a FTP proxy server, CAB _shouldn't_ call an ftp client. Having
said that, does Zetnet have a FTP proxy server? If it does, setting up CAB
to use it may help.

Make sure the following is set in the ini file.

pcdrive = yes   ;set this to yes to make Pacifist read from the
a drive, but it   won't work with protected disks. You're
also better to use imgbuild to create a .st diskfile from the floppy.
Good luck..

image=disk.st   If you create a disk image - you point at it here!
mount=e:\atari   mount a hard drive or directory as a hard drive in
pacifist

Newsgroups: comp.sys.atari.st.tech

here's an update to the TAF MonSTEr Flea market to be going on July 11th in Toronto:

we have decided to not only make this a chance to sell and buy all sorts of hardware and software for our members as well as those outside the club; we have also decided to make this an event whereby you can learn just what you can still do with an Atari, including the Internet, desktop publishing, scanning OCR, and much much more! So far we have confirmed an Internet demo at the show (using the suite of available Internet clients running under STiNG); we also hope to have a Calamus demo and a music demo going on as well.

We're also hoping to have a number of dealers at the show as well, with people to be announced as they are confirmed. So far we will have a booth for the fanzine ST+ at the show.

We're in the midst of starting a promotional blitz for the show, with advertising in a number of the computer tabloids, the weekly tabloids, and of course on the USENET.

Anyway, here's the original announcement about the show :

Subj : TAF Flea Market July 11, 1998.

SATURDAY, JULY 11TH, 1998 is the date for another popular
Toronto Atari Federation FLEA MARKET! The doors open to
the Public at 1:00 PM and runs to 5:00 PM.

Yes, here's your chance to come to a bazaar of Atari-related software and hardware where you can shop for that peripheral or application for your ST/TT/Falcon or 8-bit that you've been looking for. Or, if there's stuff that you have no use for, get yourself a table and sell! Get rid of your old stuff or find yourself a treasure!

We're hoping to have some local dealers (and with luck some out-of-town ones) show up for this event, so we've booked a larger hall in anticipation of a good turnout. To help with the costs of the event, the following will apply.

A Half-Table costs just $5.00, Full-Table just $10.00 each. A Half-Table is FREE to TAF MEMBERS. (Dealers are expected to contribute a little more <grin>), with entry to the Flea Market at $2.00 per family (Free to TAF Members).

The Flea Market itself will run from 1:00-5:00 PM (with setup commencing after 12:00 PM and teardown at 5:00 PM). This should allow enough time for as many people inside and outside Toronto to show up. We'll keep you posted on who will be showing up for this event as we make confirmations.

As usual, piracy cannot and will not be condoned at a TAF Flea Market - anyone caught selling pirated software or stolen hardware will be dealt with severely!

Please refer to the bottom of this document regarding getting in touch with TAF on booking tables or finding the location of the event - and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the Gold Room of the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library Building at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex next to the Novatel Hotel Those using public transport can take the TTC's line to the North York City Centre Station and walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall.

That's Saturday, July 11, 1998, 1-5pm for the TAF FLEA MARKET.

I have a Falcon '030 with 4Mb RAM, 85Mb internal IDE hard drive, a mouse, and VGA and ST monitor adapters that I'd like to find a good home for.

Included is the following software w/ manuals:

- STalker 3.02
- Wordperfect 4.1
- Flash 1.6
- GFA Draft Plus
- MultiDesk Deluxe
- NeoDesk 4
- Pagestream 1.8
- C-Lab Creator SL 2.2
- Geneva 1.02
- STeno 2.0
- LDW Power Spreadsheet

Please send e-mail to gold@aros.net if you'd like to make an offer. Thanks!

All right, no replies when I posted this weeks ago. So I'll just post it again... :P

Ok, I've got a 520STfm with a 2mb upgrade card and an interesting TOS 1.0-1.4 switcher, that I want to move over to a MegaST2. Using knowledge gained from upgrading a different 520ST to 1mb, I managed to rip the chips off the memory upgrade card, and put them in the mega along with capacitors next to each chip, and three resitors at R71, R72 and R74. Seems to work, (4mb, maybe I can get a usefull MiNT setup now...) but I just want to be sure I didn't forget something thats gonna make it explode later...

The TOS switcher is rather interesting, it uses a method I've never seen mentioned before... It uses custom burnt chips which are set in the sockets with pin 1 pulled out. They all have pin 1 strung together, with a resistor (brown black red gold, too lazy to dig up my electronics notes...) connecting pin 1 to pin 15 on one of the chips, as well as a wire with a switch connecting all the pin 1's to ground. When the switch is open, you get TOS 1.0, when closed, you get 1.4.

The problem lies in that the switchable TOS uses a six-chip set, but the mega has its stock two-chip TOS 1.2. The switchable TOS has chips labeled U2 through U7, but the mega has sockets labled like this:

```
U4  LO-2    U3  HI-2
U7  LO-1    U6  HI-1
U10 LO-0    U9  HI-0
```

What order do the chips fit in the sockets? And what magic jumpers do I have to set to make it use six chips instead of two?

I should've mentioned in my original message that I live in Salt Lake City, Utah. (Incidentally, I'll be traveling by road to Seattle in a few weeks, so if you live between SLC and there I can probably personally deliver it.)

Hi there. I have the following atari hardware & software for sale:-

Atari 520STFM with 1MB RAM
& Autoswitch overscan board   35UKP O.N.O.
& Original Discovery Pack Software & Manuals
(STOS BASIC, First Basic, Outrun, Carrier Command,
Bombjack, also 2 boxes of miscellaneous disks & games)

14Inch VGA Monitor   20UKP O.N.O.

Star LC20 Dotmatrix Printer   20UKP O.N.O.

Alpha Data Hand Held B&W Scanner   25UKP O.N.O.
+ Touchup Software

Software:-

Protext V6.5 (full package with manuals)	8UKP
TCB Sound Tracker	5UKP
Master Sound II Software & Cartridge	6UKP

Games:-
Frontier:- Elite II
F29 Retaliator
The Hollywood Collection (Batman The Movie,
Indiana Jones & Last crusade, Robocop,
Ghostbusters II)
Flood
Populous
3d Construction Kit.
Sapiens
Epic
Robocop III (the 3d game)
Plus many others. All games 5UKP each.

Magazines:-

80+ STFORMAT & Atari ST USER	15UKP the Lot

All prices in UKP.

When I bought a CD drive for my Falcon, I could read data but not play music CDs until I upgraded to the latests version of ExtendOS so it's quite posible that you'll see a data CD. It's worth a try anyway.

Keith

Hi!

I need a 16MHz clock from my 520STe. I believe I can get one from pin 16 of the video shifter. Is this correct, and if so, where is the video shifter?? Alternatively, short of fitting another oscillator, where can I get 16MHz from.

Also, I've tried using Darek Mihocka's Quicktos program to run TOS 1.0 on the STe as swapping between it and the old machine is getting somewhat tiresome. However, it doesn't work! Does anyone know if TOS 1.0 can be loaded from disk into the STe. If so, what do I need?

Thank You!

David

I have a C-Lab Falcon MKII which I purchased from Toad Computers 2-3 years ago. Since December of last year I had been having trouble booting the Falcon with the cdrom drive and scsi cable connected to the Falcon's scsi port. Every time I tried booting the Falcon in this way, the boot partition would become corrupted and I would have to reload the boot files. The other day, I tried it one more time and the worst happened...the Falcon no longer operates. The fan comes on, the hard drive starts to spin up, and nothing else happens. I disconnected the hard drive and tried to boot from floppy---nothing. The fan comes on and the power indicater light comes on but that's it. No floppy activity. Does this mean that my $1400.00 computer is now junk? I am now very frustated, sad, and angry. What can I do now to rectify this situation that won't cost me an arm and a leg to fix? All I really want to do is to get the machine up and running again in order to be able to use it as trade in for a TOS clone motherboard/cpu.
Thank you,
Sam Ferrer

Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

Why don't you keep it? I've still got a working ST. I keep it in order
to make copies of Kozmic 4 and Zonk, two shareware (now freeware)
programs I wrote in STOS Basic. I *still* get the occasional order!

I use my ST with an NEC Multisync monitor which works in all the
screen modes. I've still got my BBC Micro as well. I actually sold my
first computer, a UK101 with 6502 CPU.

Dave

I wrote a detailed description on how to do it but seem to have mislaid it. If you really want to do this I can find it for you? Otherwise, I believe Atari Computing is going to pubish my article, but I'm not 100% sure.

Do you intend to add a 1.44 B-drive or rip out the 720 A unit and replace it?

If you really have an STe then you better buy another oscillator, they're cheap.

There is a diskbased TOS 1.0, it has the form of an image dump and is consequently named TOS.IMG. It is loaded by a routine in the bootsector.

It works nicely with many .PRGs but some require
a TOS in ROM.

Email me if you want a MSA image of such a disk.

Hello,

It dug up my old atari (1040STf) and it refuses to read any disk while booting.
I only heard the drive running but he doesn't read any track and no drive
is shown on the desktop.
Any hints ?

You can use the disc based version of TOS 1.00 with the STE. AFAIK FaST Club do/did it although it's a long time since I saw a catalogue of theirs. Their address is:

FaST Club
PO Box 101
Nottingham
NG2 7NN

Telephone: 0115-945-5250
Fax: 0115-914-0545

and their web site is:

http://www.cix.co.uk/~stclub/

HTH.

Hi

I would like to install MintNet on my Hades 040. This is my current
system setup:

Hades 040
FreeMint
N.AES
one Minix-partition
STiNG
CAB 2.0
Jinne-desktop

I have downoaded a package called PPPKIT14 but that kit asumes that I
have no MiNT or N.AES installed previously. I think it must be
possible to just extend my current setup without deleting my old
N_AES.CNF or MINT.CNF files, as PPPKIT14 suggests.

Yours sincerely

HortCon

No drive icons avaiable?

Remove DMA, or/and the driver behind.
If you hear the drive makes noises (motor) it's a good sign.
You hear also step noises? (tack,tack, tack) ?

Looks like the sound chip are ok (He delivers the motor on, step
and drive select signals)

All the other signals are from the internal dma chip.
I think you have to replace it..

Regards, Robert

I did that on several machines. All needed logics fits even in the smallest PALCE or GAL.Problem is in the fact that almost none of modern drives have HD signal on the connector and you have to take it out directly on the switch or some labeled point on the drive electronics. There is no receipt how to do it, because it varies from drive to drive. Use of GAL is nice, because it can hold even a bit extra gate or two in order to have HD-capabilities also on drive B. I think I still have those few equations for CUPL and could soup-up jedec file for GAL16V8 if you need it....

The Sanyo I mentioned was a "Sanyo CDR-254". So it's probably the same
problem.

Correct. If it is used under MagiC and called by SPINMAGX.XFS during
startup, the position in the auto folder is not relevant.

I have for sale an Atari STE with 4mb installed and a STFM 512k.
The hardware extra�s are Mastersound II sample cartridge, Playback Stereo output cart for STFM, Synchro Express disk duplication cart 4x 256k SIMM upgrade for STE (1mb) and 2X1mb SIMM for STE(don�t know where the other two went?) and an external floppy.
Serious software is Hisoft Devpac ST assembler/debugger, Quartet sample sequencer, STOS, ST Sprite Factory and Chameleon, Canvas art package and Falcon and Mission disks 1&2 and a spectrum emulator.
There�s also an assortment of games. Vroom, Head over Heels, F29 Retaliator and more but some games are missing boxes and instructions.
I�ve also got the Atari STE Turbo pack software but at the moment I can only find games disk 5 of the games disks, complete set of Atari Power Pack STFM software.
Cover disks , ST Format :-5,8,15,17,20,22,24,25,27,34,35,42,44,56,62,64,65,67,69,72. and additional disks with Spectrum 512, Write on, GFA Draft plus 3, STOS, Protext v4.3, Interphase game, GFA SPECIAL (basic 3.5, assembler & raytrace), Knife ST and Personal Pascal.
Atari ST User Jan (STOS 3D), Apr (Hisoft C), May, July ,and Sept (STOS again) and a few disks from other magazines.

There is other games, hardware and software but I have not sorted it out in the attic.

�120 plus postage, I�m Darron at dazzaroo@globalnet.co.uk

I read in the instructions to this board that only one piece of software uses a FPU on the ST. They didn't mention what it is?

I seem to remember that connecting a FPU to a 68000 system doesn't really do a lot as softtware has to be specifically written to see the FPU.

I do have a FPU to fit in it mind but would have to find/buy the oscillator as none is supplied.

Also would a FPU in the system cause any compatibility problems.

While the ADspeed ain't an enormously fast board compared to one of the PAK jobbies I was surprised to find that it outpaces the Mega STE! and its only a 16MHZ 68000 board. I did think with the Mega STE being purposely built around a 16MHZ 68000 it would be a fair bit faster.

Why are graphics speeded up with ADspeed more than a Mega STE?
PCs are great its Windows that's rubbish.

does anyone have any hardware or software reviews from many of the atari
magazines published over the years.I sold all my magazines mant moons ago but
now need the reveiws of reference because i am constructing a new disk mag for
the Atari. Maybe you could send me a scan of the articles in question or gave
me a review yourself of the hardware and software you have used over the
years.Please relpy to me direct at jadams1644@aol.com

IDE and parallel printer ports have nothing in common. Get a SCSI drive
and a SCSI adapter.

Cheers,
Nick

I suppose this project is related to fitting high density drive. I tried
using the video shifter signal, but it wasn't very reliable and made
things a bit screwy. It is better to get a separate 16MHz oscillator.

FYI, on an STE, the video shifter is the square socketed chip under the PSU, at the left of the SIMM sockets. The pin numbers are marked.

What software still requires TOS 1.0 ??? except from some very old games, most software should now run on the STE. Maybe you have another conflict that makes the program crash.

Cheers,
Nick

Hi Atari Gurus

I have to transfer 20MB of data from my old 512ST to my PC to use the data with PACIFIST. I tried PARA2000 to set up a parallel link, but it doesn't work. Maybe I have the wrong cable.

I both tried to run PC - PC and PC - Atari ST connection with my parallel cable and both of them failed.

Here is my cable pinout:

```
 1 --- 11
```

2 --- 2
3 --- 3
4 --- 4
5 --- 5
6 --- 6
7 --- 7
8 --- 8
9 --- 9
10 10 not connected
11 --- 1
12 12 not connected
13 13 not connected
14 14 not connected
15 15 not connected
16 16 not connected
17 17 not connected
18 18 not connected
19 --- 19
20 --- 20
21 --- 21
22 --- 21
23 --- 23
24 --- 24
25 --- 25

One System said something like:
Oops, invalid command 255

another said:
Oops, invalid command 0
and the ST said BUSY

All PCs have been set to either Bidirectional or EPP.

Does someone have an idea ?

The other possibility is: The Atari HD is SCSI, I can also use SCSI on my PC. Is there a way to make a hard disk compatible for both DOS and TOS. I then could copy the files to an extra HD and carry them into the PC.
But until now I either could use the HD in my PC or in my ST, but never in both of them.

Is there another way of copying the data. Please don't mention 720k floppies. It will take forever !!!!

Thanks
Uli

Try also PARCP, with which you'll find the cable pinout. The URL is in
the Quick FAQ.

>
> All PCs have been set to either Bidirectional or EPP.

There's a setup in the PC BIOS that needed changing on my PC. I can't
check right now though, but there were 3 options for the parallel port,
and only one of them worked.

You'll need either Bigdos or HD Driver. The disk will need reformatting
to be made compatible.

Try ghostlink, it uses a standard serial null-modem cable and is easier
to setup. You need to run it in DOS on the PC (not Windows DOS
emulation, real "restart in MS-DOS mode".). It will probably take all
night to transfer 20Mbs, but as it's a one-time-only job, that shouldn't
be too much of a problem if all else fails.

> Thanks

You can transfer over the serial port using any comms programs. Better still use the ST PD program Ghostlink which gives you rather better control. It will only go at 19k2 as this is the limit for the ST. You would need a 'null modem' cable.

Note that you shouldn't run STinG with MiNTnet. It's one or the other.

You need Net-1.01b.tgz from ftp.funet.fi/pub/atari/mint/network
which should install on your stadardized Unix filestructure.

You probably also want PPPD 2.2.0e from the same place.

Hmm, what do you think is the FDC (WD1772 or similar) good for in your computer? Indeed the problem may be the fdc, the dma chip, bad cables or a defect floppy drive or ... replacing the dma chip is just one thing that may solve the problem. You may consider to test your computer with a hard disk, before you remove the dma chip. If the harddisk is accessed correctly the problem is definitely not the dma chip.

There are more of them.

> I seem to remember that connecting a FPU to a 68000 system doesn't
> really do a lot as softtware has to be specifically written to see the
> FPU.

Connecting a FPU into a 68k system works very well if the os is implemented the way motorola suggested. But unfortunately Atari made his own thing with it's tos1.0 (especially the misuse of the line f handler) that prevented most software from using a installed fpu. With most Compilers you have the option to

compiler your code for sts without fpu, with old atari style fpu
(like on all 68000 based ataris/speeder cards) or with line f fpu
(like most 68020/68030 based machines).

> Also would a FPU in the system cause any compatibility problems.

No.

> While the ADspeed ain't an enormously fast board compared to one of
> the PAK jobbies I was surprised to find that it outpaces the Mega STE!
> and its only a 16MHZ 68000 board. I did think with the Mega STE being

The Mega STE is just a ordinary STE with some extensions including a
16Mhz speeder card just like the one you have.

> Why are graphics speeded up with ADspeed more than a Mega STE?

Because your speeder card is faster than the one inside the Mega STE.

Well, actually, the official explanation was always "The OS", even though it really does sound like the name was probably started as some kind of private joke.

The initials "ST" also ring a bell, but Sam Tramiel always said they stood for "Sixteen Thirty Two". I never really beleived that either...

Cheers,
Nick

Not sure if my Falcon's 2.5" Toshiba is dying, but...
The G: partition is slow as molasses. C - F are all fine. Diamond Edge reports nothing wrong with the partition. But if I check for bad sectors, DE checks about 3% and just locks up. I'm getting the "Your output device is not recieving data" sometimes too. Does this sound like the drive is failing? I'm using HDDriver 4.51 and its still setup the same as the day I first installed it.

Any ideas??

If after seeking for floppy (motor ON & drive selected) ST does not receive INDEX
pulse
it assumes that it has no floppy unit atached, so it does not show floppy icons
(I'm
not 100% shure of it, but pretty confident).
In near vicinity of your FDC1772 there must be TTL buffer/inverter 7406. Try
replacing
it first.
Because of it's cheapness don't bother with unsoldering. Cut its pins with a sharp
blade, unsolder each pin remains from PCB, clear the solder from the holes and
solder
in new one....
But before trying this, try using other floppy unit, just to make shure that
failure is
on the PCB and not floppy. If you want to use PC's floppy for that purpose, you

have to
change it's settings to the first drive
(marking drive0 or drive1, depending on the mood of the manufacturer). If you forget to
do this, even if the rest of the computer O.K., everything will behave the same as before....

Regards,

Branko

Wasn't it just "SixTeen" for the ST and "ThirtyTwo" for the TT as the ST was a 16-bit
computer and the TT a 32-bit? Not that it realy matters....

The ST has a 32 bit 68000 with a 16 bit databus, hence the term
"Sixteen/Thirtytwo", while the TT has a 32 bit 68030 with 32 bit
databuss ("Thirtytwo/Thirtytwo").

Hi Jo! Correct me if I'm wrong here, but didn't the TT also have a 64-bit
video redraw? Thanks!

PS Managed to catch and record almost
all of B-5 with its second run on
TNT here in the States. Absolutely
lovely series! ;-)

PSS Beer isn't too bad either! <sloppy grin>

Hi Magnus! AFAIK, the M68000 chip is 16 bit external and 32 bit internal. The TT on the other hand is full 32 bit... ;-)

I�ve had the same problem! I hated it and thre my IDE-drive away and bought
a SCSI-drive instead...
Well, the drive is not _dead_, it is just falling apart, bit by bit...
Reformat, zero, repartition etc and try again!

Good luck!

/Peter

this happend to me about a year ago back what yoy can up and change it
the new breed of ide's both 2.5" and3.5" are a lot faster and more
reliable

Complete Atari Computer System For Sale

Please make best offer on entire system or individual component(s):

* Atari Mega ST2 with 4 MB RAM (original 2 MB, plus 2 MB added)

* Spectre GCR cartridge with Mac ROM chips (emulate Mac Plus/read & write Mac disks)

* 48 MB Seagate external Hard Drive (in ICD FAST casing)

* Atari SM124 High-Resolution Monochrome Monitor

* VideoKey (converts RGB to composite color)

* GTS-100 3-1/2" Floppy Disk Drive

* Panasonic KX-P1080i dot-matrix printer

* Applications: MS Write, 1st Word Plus, Degas Elite

* 13 games

Please respond via email to rparker@slip.net as I do not frequent this newsgroup.

p.s. I am located in San Francisco, so sale would be easiest to facilitate to someone in Bay Area.

Wow, you guys are getting stiffed!

In San Diego, California, we can get a mini tower with 230W power supply
for US$20 (approx 13 ukp), including our sales tax!

Well, yesterday I bought a MAC II with a 14" monitor, that I want to
connect to my Falcon (the monitor, that is).

The monitor has a 15 pin connector, I think. Does anyone know how to connect
these 2 together? It would be great to finally have a real monitor.

Well, you're not very specific as to what type of monitor that Mac thing
is, either RGB or VGA or some other weird Mac standard.

If the connector is a HD15 type (like a parallel or serial port

connector but with 15 pins in 3 rows), it might be a VGA, but I wouldn't
bet my life on it.

You can try building an adaptor with the stuff found in the Quick FAQ or
in DOITF030, or get a normal falcon/VGA adaptor from your local atari
dealer.

: Well, you're not very specific as to what type of monitor that Mac thing
: is, either RGB or VGA or some other weird Mac standard.

It says Macintosh Color Display on the back, the computer was an
Mac IIvi, I think. (I do not have it around, since I only wanted the monitor,
I gave the rest to a friend)

: If the connector is a HD15 type (like a parallel or serial port
: connector but with 15 pins in 3 rows), it might be a VGA, but I wouldn't

No, it is 2 rows, 8 on top and 7 below.

Hi,

I have a Mega ST and two megafile HD's (20 and 60 MB). I wondered if it was possible to put these three things together in one tower. Does anyone has an idea where to get pieces, how much it will cost and which difficulties I'll have to face (bringing all the ports to the outside of the tower, internal ACSI link, power supply,...)
TIA

I planning in doing the same with my mega. I know its possible because I heard of it done before. I think the mega will fit in a mini tower which will have space for harddrives in it. The ports might be the difficult bit but maybe possible to sit the main board so that the sockets are on the outside already.

Mini towers are realy cheap, about 30ukp here and the only other things would be cables and stuff which should also be cheap.

Good luck with it

Niall

I have a selection of Atari ST titles for sale.

This List Updated 30/5/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
Prices DO NOT include postage.

***********************>>>>>   Disk Bundle   <<<<<<***********************

Lemmings 2 (1d,ds,1 meg), Archipelagos (1d,ss,),
Black Lamp/Outrun (1d,ds), Test Drive (1d,ds),
Fantasy World Dizzy (1d,ss) & International Soccer (1d,ss)

All the disks are on original media, but have no instructions or boxes.

All 6 disks above for only 5 UK pounds INCLUDING postage.

Hi,

I would like to know if stzip v2.6 can be used on a Falcon 030.
Also is Flashbak v1.7 compatable with a Falcon 030?
It was a backup program written for an ST.
Hard disk to floppy. I cannot find any info on it on the net.
Does anybody know anything about this program?

thanks

It also shows Tiny pics. It handles 'animated' pics (actually pics with color cycling) in both formats.

Stzip v2.6 runs on my Hades 060 and TT030 so I don't see any reasons why it shouldn't run on a Falcon.

>Also is Flashbak v1.7 compatable with a Falcon 030?

I don't know. I never have heard of it.

Hi,

I have a serious problem with my pppd 2.1.2 for Mint. It almost always fails in its PPP negotiation. It seems to me that my pppd does not get (for some reason) its own [local] IP address. After some resending of the remote side, there comes a "LCP terminated at peers request" or smth.

I have MintNet (from KEMD rev2), HSMODEM (from idem), and the HSMODEM hsminst.xdd for Mint. Some other odd problems :

* I cannot use the hsmodem2 device with pppd ; pppd says it cannot find a tcaddress or smth like it.
* I cannot use 33600 Bps rate with pppd (it simply refuses it).

BTW, I have a USR Sportster Flash (56k) now, and previously a USR 9600 FAX modem. My terminal connections to the same server work just fine with these, but the ppp not.

Please help !

Degas Elite supports color cycling. I don't remember if plain ole Degas does (I don't think so).

As for where you can get some, I don't know. I used to have several really cool ones, but since upgrading to a Falcon I've lost them all, as I no longer use Super Boot, and 16 color pics don't excite me anymore. ;^)

I've never gotten hsmodem (even with the device) to work properly with
pppd. Try removing it, and seeing if you get a different result.

Also, do you have the debug output? If you like, email me portion of the
PPP log after the login has taken place.

Hi Folks,

FLASH-BAK v1.7 is a High-Speed Hard Disk Backup program (Hard disk to floppy) that was written about 1987 by David Jones.

TRIANGLE Soft Innovation

EIDERSOFT
Software, Ltd.

Does anyone know if this was ever upgraded so that it could be used on a Falcon 030?

I can't find any additional info on it.

Thank You

The message <6kqiab$s98@newsops.execpc.com>
  from Ken Kosut <kjcat@execpc.com> contains these words:

Yes you can use stzip v2.6 on a Falcon. It also works with magic and
nemesis installed.
I don't know about Flashback though, as I have never used it.

Tim

> Hi,

> I would like to know if stzip v2.6 can be used on a Falcon 030.
> Also is Flashbak v1.7 compatable with a Falcon 030?
> It was a backup program written for an ST.
> Hard disk to floppy. I cannot find any info on it on the net.
> Does anybody know anything about this program?

> thanks

Hello,
could someone be so kind as to send me a copy of the MagiC Mac demo as an e-mail attachment. Please son't send me the URL for download, for some reason when I download it, it thinks its a TeachText document. I tried changing this in ResEdit, but to no avail.

Thanks,
Jason Walsh

Thanks Keith.  It sounds like a hardware problem, but your experience seems to
indicate that there's a software factor too.

Hmmm...

I'm trying with a Data CD now and it's still not making much difference... B^{<

 >> 19706 bytes...
 r>
 r> It's 26338 in v5.02. I'll e-mail it to you just to see if it helps.

Please don't send UUEncoded files to me at this address. The BBS Gateway here automatically scans for this data and deletes it before arrival - otherwise Paul would be paying for even more of my mail.

Any UUEs should be sent to me at sidcelery@cix.compulink.co.uk - I'd be grateful of a full copy of the latest CBHD archive, if you don't mind...

In the meantime I've tried this old version of SCSIDRV and it does enough to get me an empty directory of a Computer Shopper data-CD cover disk, but no more.

It doesn't seem to matter what I do, but after the first access of the CDROM I either get "Unit is not responding to Inquiry" error messages from SPIN or that it suddenly can't access ACSI 0,0 despite being correctly reported by HDDriver.

Maybe it's to do with the old version of SCSIDRV or the relatively early version of HDriver with the generic SCSIDRV (v7.04).

 r>
 r> Well, whatever it SAYS I have got my kit working with a similar set
 r> up to you. The only difference is that I am using CBHD as the system
 r> HD driver. Perhaps you should think of installing this as a one-time
 r> trial. I'm a bit stumped now!!

I don't like doing that kind of thing tbh.

I've now tried Metados v2.5 (hard disk corruption wiped my v2.7 archive B^{<) with SPIN_SD.BOS and the newer ISO9660F.DOS and I get similar problems. Nothing seems to want to work. B^{<

I'm beginning to suspect the drive itself B^{<

Hi,

Is there some way to network a Mega ST 4 on Ethernet
IP and FTP client or server would be nice
10BaseT (preferred) or 10Base2 or 10Base5

Please, also provide HW refs, prices and urls to soft(kernel, drivers,)

Many Thanks

I'm trying to upgrade a working MegaFile 30 to a
dual drive MegaFile with a 60 Meg Microscience HH-1060
and a Seagate ST-157R drive. I am having problems getting the
Microscience drive to format. I want to use HD Driver 7 but I
can't get it to see the drive. ICD Pro 6.5.5 doesn't see it
either. But, ICD Pro 6.4.3 sees it and is happy to start
formatting. The drive spins up normally and sounds
like its stepping tracks while formatting. Eventually it always dies.

I'm a newbie with Atari stuff so could have made any dumb mistake.
I've had luck formatting SCSI drives with HD7 so have a little
experience.

Is the HH-1060 supported on the Atari? What steps should I follow
to get HD7 to see the drive so I can format it?

Thanks,
Don

macs use a diferent conector for some reason but the monitor should be conpatable

i supose you could get a mac to vga adapter and then a falcon vga cable

You need hard drive utilities that will support LUN 0 and LUN 1 if you want this to work. Supra HD Utilities will do the job and I think the last version is freeware at their web site.

Of course, I am assuming that you soldered the additional 20 pins to your MegaFile motherboard for LUN 1, that you have the proper cabling, and that your drives are jumpered properly.

Hope this helps,
Randy Kwak

I'm still having problems connecting a CD-ROM drive to my beloved STE:((

I haven't until the last few days or so, been able to test the SCSI device (CDR) with another hard drive; this was a power computing SCSI. I am getting exactly the same response as I did before; Hard Drive failing to boot and the HD structure not being recognised correctly (760+meg of used data on a 127 or 52 meg HD!)

I have now able to try them connected to a PC, and they work in perfect harmony with each other.

The HD's are a MiniS 127meg, using a Quantum LS127S which has internal terminator, easily changed ID and has the parity switched via software (or so the ICD info tells me) and the ICD software claims that parity is disabled! The other HD is Quantum 54meg drive, fixed ID=6 and internal terminators.

The CDR's is an Apple CD300 with a Sony 8003A machinism, easily changed ID and no internal termination. The other mechanism that I've tried is a Toshiba XM-3301B.

The DMA-SCSI adpators that I've used/tried are: ICD Link 2, Translator as supplied from System Solutions with the MiniS HD and the one supplied with the Power Computing HD.

I have also tried it on at least 7 different ST's: 2 x STE's under 1.62, 2 x STE's under 1.6, 2 x STFM under 1.2 and 1 x STFM under 1.4.

One 1.62 and both 1.6 STE's were 4 meg, the other 1.62 was tried with all possible memory configurations. One 1.2 STFM was a 1 meg and the other 1.2 & 1.4 are 1/2 meg's. And finally I have also tried under 2.06 on a 1.6 & a.62 STE's with 4 meg.

I have used the following HD drivers: ICD v6.5.5, HD Driver v3.1, HD Driver 7.1 Demo, GBHD v5.02 and a German one. The CD driver tried are Spin v34, Extendos Pro and MetaDOS 27.

I have checked for the following: clashes with ID numbers, removal of internal terminators and soley relying on external (i.e. on the end of the chain), also every possible combination using both internal and external terminators. All devices work with each other with NO problems on a PC.

Because they are working on a PC makes me believe that I've done or am doing something wrong! All I want is to get the #@*&~%# things working with each other, before I crack up.
Cheers! for now
               Steve

Hi All,-
I got my hands on a Microtek ScanMaker II, model MRS-600ZS, but what kind of
driver/software do I need to get this to work on my Falcon 030?
Is there a demo soft for this? Or do I have to buy the software from Homa System
without trying it first?

Is there a nother driver somewhere?

cheers Joergen

Hi People,

I'm relatively new to this scene and have, what may be to you wiser folk, a couple of silly questions:
i.e.
1. how do I get to an ftp site ?
2. why do I have to have CAB (1.5) load any .HTM on boot up or it won't let
   me open any URLs (I get two bombs and returned to the desktop).

I am using a Falcon (14 megs + Nemesis) and the software supplied in the ZetPack - with the exception that I have at long last managed to get a connection using STiNG (v1.15) and this has replaced STiK.
I am single-tasking and have as few accessories active as possible to avoid conflicts.
My CAB OVL is v1.2904 and my system seems stable on most sites but, for example, when I go to ZetNet's Support page and try to download the ZetPack (to get the latest version of Newsie) I am told there is an error in the Cache - the link shows as an ftp ....

Any help/suggestions would be appreciated.

Thank you.

ABT

Jim.

Every browser I've ever used (Mosaic, Lynx, Explorer,
Netscape, CAB) has had a default display page, usually
from disk or a selected remote site.

I suspect it's the nature of the beast.

Is it possible to replace the megafile 30 HD with a MFM
HD of higher cpacity? Say a Miniscribe 3650, 40MB HD?

Yes, but it needs a bit of soldering

You could also try a cable connection and let it run all night.

You'll find it all in the Quick FAQ

Cheers,
Nick

hi folks,

about 5 weeks ago i got midicom and was glad to have it, cause the only progy i�ve seen since then to make a small "network" with my falcon & megaSt was littleNet, which unfortunately didn�t work with my falcon.

everything seemed to work fine (i enjoyed using 1,44mb disks "on" my megaSt, via the falcon floppy), but then....

...each software which used nvdi was unable to use true-type-fonts; although nvdi was well installed while booting the system, i was unable to use ttf�s in papyrus: it always said "NVDI not installed". so i tried to fix the problem. i disabled various new software in the bootmanager, and as i turned off the midicom-driver and accessory, nvdi worked fine again.

i had a suspicion that something must have happened to the nvdi-cookie. so i enabled midicom again and watched the cookie-jar with the cookie-cpx, and there it was: several "cookies" with wild charakters, and some of the cookies which usually had been there (f.e. the nvdi-cookie) were wiped away.

is there anybody who made similar experiences with midicom?
does anybody know what the reason for this problem is, and how you can fix it?

excuse my terrible english, i learned it a long time ago and (almost) never used it since today....

thank you, greets   -micha-

Yup.  It's called MagiC.  Available from
all Atari dealers.

-- George Crissman
-- strads@tmisnet.com

Oh, yeah.  The Atari dealer list:

I edit a magazine called Portfolio Times and it is printed on paper. I want to move to a disk base mag but it has to be read by users with either a ST or a PC. Therefore the best format is HTML code. I want to know the best software to use to create a disk mag?.Can anyone help me?

Well. Obviously it's not possible to write a program like that. A diagnostic
tool would have the same restrictions as the driver: it knows several
different ways to grab audio data and can try them. If the device uses
an undocumented "new" command for it, how could it possibly know?

That's irrelevant. METAXBS gets started earlier by SPINMAGC.XFS. If it
is repeated in the auto folder, this won't hurt.

Let's say that audio grabbing with IBM devices will work if and only if
the drive uses the SCSI-3 (multimedia) command for reading audio data.
There is no special support for IBM drives, nor should this be needed.

Yes, if you buy something like HD-KIT. It's a new board with a crystal at 16 mhz
with place for the old floppy-controller.
Check if you've got the floppy-controller WD1772-02-02 or even better the AJAX-chip.
You have to solder two wires, for the detection of HD and you sometimes have to
twist the floppycable 180 degrees depending on the pin config on the drive.

The big job is to unsolder the old controller.
If someone is interested I have one kit left.

Ah, my mistake. The docs. say that it should be re-named as .PRX but I
notice, from the binary, that SPINMAGC looks for both .PRG and .PRX
in the /AUTO/. It even seems to look for .SYS in /MAGIC/XTENSION/.

Yes it is possible....most STs will be able to be upgraded with
a simple modification. If you want some one to do it for you
try The Upgrade Shop, advertising in Atari Computing. If you want
to do it yourself, then e-mail me...I'll try to dig up the info

for you

Cheers.

Hi Ian

Unless you have added the serial port modification you will not be
able to use any baud rate above 19200 and then you will still need to
use hsmodem.

I run quite happily at 28800, only because I couldn't afford a 33600
modem. But remember not all BBS's etc. run at a high speed. I know of
one that still runs at 14400!

If you need further help please let me know.
Cheers! for now
               Steve

[quick scuffle as I look in my Mega STE manual] Oh yes, there it is!
(Mega STE keyboard being a TT keyboard moulded in a different colour)
Hmm, well I'm not sure there's any TOS software that supports the
"middle" button as there isn't one on the standard Atari mouse. What
you're referring to is most likely provision for the third mouse button
in UNIX, as there was once a UNIX version of the TT (complete with
mutated Atari mouse). Never seen one of these rare beasts myself.

]-David
]-.

Hi David, thanks for the post. I dunno...Its the only piece of software that I have that does it. I've never suffered this "loss of memory" before or since. Only with Pagestream. Kinda odd that only 1 program would do this if its hardware/upgrade related, wouldn't you think? ;-)

BTW, it was the Jaguar logo pic, that was originally a JPEG/GIF. I used GEMview to convert it to (X)img. Does anybody know if that could have anything to do with it? The DR2 test object that comes with Page Stream loads up just fine. Or could it be that during conversion the picture became corrupted?

I've managed to get this running, but it does
not know the PC a: drive, which is where
I want to run my game from (Colonial Conquest).

is there any line to be added to the ini file to get
this working properly?

is a transfer of files required to the c: drive?

any help would be appreciated, thanks.

I've got the one from CBHD v4.56 - would it have changed since then? 19706
bytes...

 >> The CDROM is hanging off the TT's ACSI port connected via an AdSCSI

 r> Right. This gives you the CD as device P:

Yup.  I've since changed the ACSI device number to 0 just in case as well and
HDDriver picks it up, but still no access...

 r>
 r> It'll be that METAXBS.PRG, Harry.

No, I changed that too.  I also updated to the MetaDOS v2.7 which has a
slightly different ISO9660F.DOS file, but no dice.

One factor that made me think was that the MetaDOS docs say the following:

=====
MetaDOS 2.70
These are the essential elements to get any SCSI CD ROM drive going on an
Atari TT or to use an `Atari CDAR 504' CD ROM on an Atari with ACSI port. It
does NOT support SCSI drives connected to an ACSI port.
=====

Does this only aply to MetaDOS or to SPIN as well?

I am an Atari Lover and still "new" to the ST line. I was a huge fan of the 8 bit line but have become more interested in the ST line over the last year.....So much interest that I own 4 520ST's, 3 SM124 monitors, SC1435 monitor, several 314 drives, 1040STF, and a Mega2ST. Although I have all these computers, I dont know squat about them......I never knew they existed until last year!!!!

Anyway, here is the problem:

My Mega ST2 (upgraded to 4megs, running NeoDesk 3) came with a Segate (Model: ST157N) 40+Meg SCSI HD rigged in a homemade metal shoe box (have since mounted it in a Mini PC tower). It is hooked to the MEGA via an ICD "box"? Anyway, the 40+ meg drive is part. into 3 logical drives. C: 16meg D:16meg E:16meg

With this information, I would like to ask the following:

1. What is the limit of HD Part. that the MegaST can "see"? Is it 16megs or do you think that is just how the previous owner wanted it?

2. Will any SCSI HD work with the computer? I can buy a 500meg drive for $60 but I am not sure if it will work. If it will, I want to load a UNIX Based operating system to enable me to link the ST to my Win95 PC. I have read that I can map my Win95 HD's to the Atari desktop if I am running a Unix Operating system. If I can accomplish tis without changing my OS, I would love some direction.....The OS change scares me!!!!!!

3. I found an External SCSI CD ROM at work. Its a NEC model 3x. It has the SCSI hookup that is similar to a parallel port but of course very different. Any ideas if I could hook it up to the MEGA with a special cable? Maybe find a cable that converts the SCSI HD cable on one end to the "parallel type hook-up" on the other? Where could I find a CDrom driver? Then last.....where could I find a CD with software on it?

Any help would be appreciated.

It's 26338 in v5.02. I'll e-mail it to you just to see if it helps.

Yes, Julian says this doesn't matter. I am using the ISO... from v2.7.

Well, whatever it SAYS I have got my kit working with a similar set up
to you. The only difference is that I am using CBHD as the system HD
driver. Perhaps you should think of installing this as a one-time
trial. I'm a bit stumped now!!

Is anyone using an HBS T-36 (or 24) accelerator in an MSTE? I had mine
installed in a MST, and it worked quite well after a few
modifications. I haven't found an adapter to fit the 68000 PLCC

socket so I thought about making my own. I would be interested in
any problems noticed with it installed on a MSTE before investing much
time in the project. Off the top of my head, I remember having to
perform two modifications to the MST before it became stable. On was a
hard disk fix for noise on the reset line, and the other replacing the
memory latches on the m/b with ALS cmos chips.

Thanks for any help,

Mike

hi !
Hi !
I want to play games on my real atari st.I have some disc images for the
parcifit emulator, that are files like autocd.st .
How I can use this disc images on my real atari? Where I can get a tool for
this ?

Can anone help me ?
Please email me .

Thank you,

T. Wegner

transi).

What are you talking about ???

1.) We're talking about modern i.c.s, aren't we. There is no modern, only ancient,
RS232 buffers that require a negative voltage. All modern ones contain
bucket type voltage converters to generate the negative voltage out of the
+5V supply.

2.) True, a buffer needs more power than a gate, but what the heck ? Who cares
about
those microWatts ? It's negligibly small.

3.) What we have is an MFP and a mouse connector. No need for anything but ... a
buffer. If you want to replace the buffer by other circuitry, no ANDs or ORs
are required, so no way to play smart and combine a AND and a NOT to a NAND.

4.) Huuh, great, a software driver. What if the mouse driver accesses the port
directly ? Where do you want to insert the software driver ? Bad luck.

5.) If you need more than "some transi an diodes" to do this converter, then you're a poor electronician.

6.) GALs and PICs usually work with a +5V supply too, they are plain CMOS devices. You cannot make then produce RS232 compatible output.

7.) But if GALs or PICs worked, what an overkill compared to a simple RS232 buffer that was required.

Cheers Peter

Agreed.

> By the way I worked a lot with CMOS and mixed TTL/CMOS circuits (see
> also message from Timothy).

Experience is worth a lot, but does usually not cover everything. I don't know what exactly you've done. Often people come up with the notion that TTL and CMOS are mixable whereever one needs one from the other family. This is again something I'd disagree with, mostly for noise immunity reasons. Often it works fine as long as the circuit is operated in low-noise conditions. But hardware with poor grounding, for instance, can produce enough excess noise to let a TTL-CMOS mix entirely misbehave. In such cases use of the 74HCT or 74ACT family can be much recommended.

Cheers Peter

The limit depends on TOS and the HD Driver software you are using. Yours
is probably ICD software, though I've no idea what the limit is.

If the ICD "box" is a Link interface, it should handle most SCSI drives,
though only a LINK 2 will handle parity, so you must be able to disable
parity on the drive if you won't use it.

For a Unix-like OS, you'll need MiNT. Linux is available for 030
processors only, so it won't run on an ST. Look for the KGMD

distribution and the KEMD translation on ftp.funet.fi for example.

ExtenDOS is the most widespread CDROM driver.

You're supposed to make a disk image (.ST file) of the disk. Read the
docs on how to do that.

Cheers,
Nick

It applies to the files in the MetaDOS archive, not to any other drivers
like SPIN_SD.BOS.

I have been trying to use CDPLAYER v14 to read from an audio CD and write an HD .WAV file.

Unfortunately CDP tells me that either my CDROM or my driver is not up to the job and refuses to read the audio data via SCSI.

I'm not very clued-up on CD technology, can anyone help?

My CDROM is a 1995 IBM model which identifies itself as CDRM0103.

I am using Magic with SPIN v34 as the CDROM handler. At the moment I am using SPIN_SD.BOS and ISO9660F.DOS.

Is it just a case of changing the software or don't I stand a chance with the IBM device?

hello

I just bought an atari st 520 for $ 20 at the local goodwill. It came with the following -

SC1224 moniter
SF354 3 1/2 floppy
KX - P1091 panasonic printer
and 2 cables for the moniter - computer and floppy - computer

right now I have no I idea if any of this stuff works because the only thing I'm missing is a power supply. Does anybody know where I can get an atari ST 520 power supply ? and I need one for the disk drive too. What do you suggest I do , not take my chances on buying a power supple because it doesn't work ? just buy a whole complete set up because it could possibly cost as much as just buying a power supply for it ? Or buy a power supply ?

please help me , and e-mail the reply to Cubinson@pacbell.net

thank you very much

jacob

This is easy to answer: PageStream was written in the days when
the only multitasking programs were the accessories. So, PageStream
was not written to share the computer's memory with anything else (since
most accessories took their required memory at boot time). As a result,
PageStream is a memory pig. Now, how to solve your problem is trickier.

Can anyone help with this?

Leslie

MagiC doesn't support this setting though the bits for this setting have
been reserved in the NVRAM for a long time. The same applies to the
NetBSD and Linux settings.
All NVRAM settings can be changed with BOOTCONF
(http://acp5.chemie.uni-kl.de/seimet/atari_english.html).
Note that most of these settings only have an effect on the Falcon. For
the TT the only settings that have a meaning are the SCSI initiator ID
and the boot preference for TOS or the TT SVR4, resp.

You've got the makings for a very nice word processing system there. The power supplies for the 520ST and the single-sided double-density SF 354 are still available through Atari dealers, most likely B&C Computervisions.

I keep a list of known US dealers at my web site: http://www.tmisnet.com/~strads/hq/sources.html#Dealers

Give them a call, discuss your situation, and ask for a catalog of available software.

Your problem of understanding is the fact that in Germany the 1040 STFM
was the standard and in France the 520 STFM.
Personally I have never seen a sort of 520 STFM in Germany until the
appearance of the 520 STE.

Reflecting various messages from Peter and me.

Dear Peter,

I must admit, that I didn't read the original message carefully enough,
I intended to answer the second one.
Of course a mouse is mostly an input problem.
Normally the problem is driving a +-15V device with 5/0 V which in
theory can only be solved with a converter, but also works as I said.
The problem of driving a 5/0V device with +-15V is no problem, because
you can easily get the 15 V voltages down to 5 or 0 V. A simple diode,
zenerdiode and a resistor would do (not recommanded though!).
There is still the problem of inverted signals as you mentioned in the
other thread.
But in the case of Atari and their philosophy of connecting any input
and output to the heart of the system, I would anyhow recommand to use a
buffer on any external port to protect your hardware.

Conclusion: A solid converter would be the best (only) solution to meet
all circumstances and to protect your MFP!

Cheers
Wolfgang

By the way I worked a lot with CMOS and mixed TTL/CMOS circuits (see
also message from Timothy).

Hello!

I am from France and I *never* saw or heard about STFM... Until I took a trip to G.B. While I just bought a STF in France (all that sellers knew about), There where only STFM in G.B. Shortly after came the STE... Moreover, old Atari with external drive&boot were called ST (without F or FM or anything) by the sellers I spoke to.

It seems to me STF and STFM are just two different names for the same thing in different countries.

Yves.

They're identical except that the STFM has an RF modulator to allow an RF connection to a television while the STF does not.

Actually, in France there were no STFMs as such: the top labels always said STF, however, on the later models, the labels underneath with the serial number say "STFM France". I suppose the M was dropped since none of the machines solde in France ever had an RF Modulator, since they were all shipped with the superior RGB/SCART cables for TV display (All TVs sold in France since 1981 have SCART connectors). Even my STE hasn't got the Modulator hardware on the PCB. In France however, there have always been 520 (512K) and 1040 (1Mb) models, and no "520+" or "260" or whatever there was in Germany, the difference being the amount of memory, and most of the earlier 520s had single sided floppies.

I beleive that the STFM marking that appears on the case actually refers to the 2nd generation of STFs that were released (It's a Rev C motherboard, Rev B being the 1st STFs and Rev A the original ST ???).

Cheers,
Nick

Perhaps not on any television. My PAL version is not very good on SECAM,
I have never tried it on NTSC.

well all I can think of (if limiting memory under PageSTream flag
doesn't
work in Geneva) is something like DCreserve, that would prevent programs
running after it from taking more than the assigned memory.

Hi,

If anyone has some info he can always send it to me, I'll put it on my page.
About the MAC SCSI->Ethernet adapters I have some info, but wasn't able yet to put it online. I'll hope to do it this week. Maybe there will be a piece that might interest you.

I guess there are enough cards some can use, but the main problem still are the drivers. Almost nobody can (or want to) write drivers.

If all else fails, take a look at what resolution (x and y dpi) is embedded in the IMG file's header (Imagecopy will tell you). There's the small chance it's gone awry. But I don't have first-hand knowledge of Pagestream -- it may analyze and use this information. Calamus ignores it, using just the x and y number of pixels. (I'm assuming the IMG is a

color X-IMG if you're running out of memory.) All of the above is a
longshot ;-)

False. RS232 buffers need more power than gates (and someting negative voltage to

provide). When I speak about a NOT gate, I don't say "add a NOT gate", I say "use
a
NOR instead of a AND" ... or use a soft driver that NOT datas. You will have to
use
more than some transi an diodes to do this converter : at least a GAL or a PIC, so
doing a NOT inside is free ... and you use _only_ some resi externally (no
transi).

regards
Eric

Read carefully. I did not say I do not know STFM, but that I do not know
520STFM, which never made it to Germany. Of course I know 1040STFM, I have
five of them !

> Never seen that, but then again, I've never seen any of the oldest TOSless

I did. My first machine was one. It's far more exciting (in nostalgic terms)
than a 520STFM ever could be. BTW I still must have those old ROMs with
BOOT in them.

Cheers Peter

Then you know only protected CMOS. Unprotected CMOS reacts unpredictably
when fed with input voltages too far away from the true CMOS levels. Keep
in mind what the acronym CMOS really means, and consider what might happen
to such a structure for wrong input voltages.

If what you said where true, there would be hardly any point in the HCT and ACT (for instance 75HCT244 etc) logic families as compared to the HC and AC families. But they exist ...

If you wanna say the tolerance range is a bit larger generally than +/-0.5V, I will agree. What I wrote is what I stick too to let my circuits behave. Maybe a little strict, but I had the case that I ran into problems when deviating by 1.3 Volt.

Let me cite Horowitz & Hill, "The Art Of Electronics" :

> For example with high-speed CMOS logic, input voltages within about 1.5 volts of ground are interpreted as LOW, while voltages within 1.5 volts of the +5V supply are interpreted as HIGH.

> Just for example, I looked up the PowerPC 750 input levels. (Keep in mind
> here that it's a CMOS device which uses 3.3 V I/O, not 5 V.) It will
> accept 0 to 0.8 V as logic 0 and 2 to 3.465 V as logic 1.

Of course an expensive device like a PowerPC is protected by every means you can think of and that won't deteriorate the CPU power.

If I said you can get hurt when sitting in a car and getting into a road accident, you'd probably come up with saying "no it's safe sitting in a tank" ;-)

>> Trying to apply, say, 2.5V to such
>>a CMOS input will cause it to draw excessive current, enough to
>>destroy the chip !
>
> Not at all. It is perfectly safe to apply such a level to a CMOS input.

Maybe to the ones you know. It's not in general.

Modern devices are generally more robust due to their use of polysilicon gates rather than metal gates that have been used earlier. But even with those I'd be reluctant to call it safe.

```

My old 520STFM ( which was bought in Singapore ) was actually a 1040 with
512K only.  I could just plug in the other 512K and solder some resistors &
I have a regular 1040STFM ! Another guy's 520STFM in Singapore was not as
such, it was really a 520STFM, no extra slot for memory.

Rgds
William

Well, at least you've got it running.

r> I'm not very clued-up on CD technology, can anyone help?

Going by the SPIN docs it may be that the CD drive itself doesn't support the necessary commands B^{<

r> My CDROM is a 1995 IBM model which identifies itself as CDRM0103.

The one I picked up on the weekend is a 1996 Sanyo x4

r> I am using Magic with SPIN v34 as the CDROM handler. At the moment
r> I am using SPIN_SD.BOS and ISO9660F.DOS.
r>
r> Is it just a case of changing the software or don't I stand a
r> chance with the IBM device?

Equally bad problems here. This is what I've done - can anyone pick holes in it for me?

Note: it's been suggested that SCSIDRV might be broken in HDDRiver... but that may not be true.

==========
I've managed to pick myself up a SANYO 4x SCSI CDROM and thought I'd try setting it up with SPIN. I grabbed a copy of MetaDOS v2.5 from the file lists for the ISO9660F.DOS file. I know this isn't the most recent...

Running it under Magic I'm using a directory structure of:

```
        /AUTO
                CONFIG.SYS
                METAXBS.PRG
                ISO9660F.DOS
                SPIN_SD.BOS
        /GEMSYS
                /MAGIC
                        /XTENSION
                                        SPINMAGC.XFS
```

I've also got the generic SCSIDRV set up in HDDRIVER v7.04.

The CDROM is hanging off the TT's ACSI port connected via an AdSCSI host adaptor as ACSI 1 and the CONFIG.SYS looks like this:

```
*BOS, C:\AUTO\SPIN_SD.BOS, A:1
*DOS, C:\AUTO\ISO9660F.DOS, P:A
```

Before setting the software up I connected everything and got IDCHECK to confirm the device was being recognised as ACSI 1 - it was.

So far so good... until I reboot...

I get an error message from SPIN_SD.BOS of the following during bootup:

```
 unit not responding to TEST UNIT READY
```

Followed by (from METAXBS.PRG):

```
 BOS error: device not responding.
```

Using some guesswork I modified an executable to look for SPIN_SD.BOS in upper case, and the error message changed to:

```
 unit not responding to INQUIRY
```

Trying to run one of the CD Player utilitiesfrom the file lists I get the error message that MetaDOS isn't loaded. When I recheck for the CDROM being recognised by IDCHECK it no longer appears...

Has anyone got any idea what I'm doing wrong? Or is it that the CDROM really isn't responding?   The problem seemed to start when I put the XFS in the extension folder. Could it be that?

All help appreciated...
==========

I don't think so because a lor of users run the SCSI driver integrated in HDDRIVER with SPIN!, GEMAR etc.

> The CDROM is hanging off the TT's ACSI port connected via an AdSCSI host

Why don't you connect it to the SCSI port. If possible, use SCSI not ACSI because SCSI is faster and more modern.

> unit not responding to TEST UNIT READY

Did you enable the correct device ID in HDDRIVER with "Device Configuration".

Also note that there have been several new versions of HDDRIVER. The current version is 7.5 with a demo available on httpL//acp5.chemie.uni-kl.de/seimet/atari_english.html.
You might want to try this version with your CDROM device.

Funny if it is PageStream causing the problem than can someone please tell me why it is that using Gevena I can run Pagestream and Touchup together on a poor old 4 meg MegaSTE? I don't beleive that it is the software that is causing the 'loss of memory' on his 14 meg machine. Anyway that is my 0.02 cents

David

Second point..
I'm not sure SPIN supports IBM devices. (Ask Julian Reschke)

>Is it just a case of changing the software or don't I stand a chance
>with the IBM device?

First ask IBM for a manual or also..
Have a look to the IBM Webside (Devices)

Example: Most of the yamaha devices do that perfekty. (With SPIN, CD-Tools)

         XM4101
         XM53xx
         XM57xx (12-speed)
         CDRW 4260 (Burner)

What's displayed on the screen? Black?, White?, no logo?

Next point is a defective internal IDE device...
With a disconnect internal ide you must wait a while..
After x-time the machine try to boot from floppy disk.

If not, we have to check more..

 u> (http://acp5.chemie.uni-kl.de/seimet/atari_english.html).

Got it, thanks.

 u> Note that most of these settings only have an effect on the Falcon.

Oh B^{<

 u> For the TT the only settings that have a meaning are the SCSI
 u> initiator ID and the boot preference for TOS or the TT SVR4, resp.

Ok, but what difference will I find in switching between 'None' and 'TOS'?

>This is easy to answer: PageStream was written in the days when the only multitasking programs were the accessories. So, PageStream was not written to share the computer's memory with anything else (since most accessories took their required memory at boot time). As a result, PageStream is a memory pig. Now, how to solve your problem is trickier. Can anyone help with this?
>

Yes, PageStream is a memory hog. In the past I had problems with out of memory messages and etc. But now it seems to work fine on my 14meg Falcon. After reading the original posting, I examined my current settings and did some test printing.
Here is some information that may help someone who is having problems with PageStream running on a Falcon.

System Info.
PageStream version 2.2b.
14meg Atari Falcon 030, Tos 4.04, No hardware upgrades.
Latest version of Geneva and NeoDesk.
HP540 DeskJet printer.

After booting the Falcon with Geneva/NeoDesk, lots of Auto programs, and 14 Accessories. I have 7.5 megs of memory available.

In Geneva's Tasks, I have all of PageStreams Permanent Execution Flags checked except for these 3...
Limit window handles
Windows off left edge
keep menu bar/desktop
(These may/maynot cause problems)?

Limit memory is set to 3000 kb.
(You may want to increase this if you want many large graphics in your PageStream documents.)

Fastload is set on for PageStream.

After running PageStream, I checked the Xcontrol panel v.1.31 general setup status. And it reports...
ST Free Ram 3982376.

Then I checked the About PageStream dialog box and it reports...
Program Free Space 2449212
System Free Space 100000

Then I created a New Doc. and loaded a 544365 byte GIF picture into the Document.

Then checked the about PageStream Dialog box, it reports...
Program Free Space 869708
System Free Space 100000
Document Size 790558
Number of Objects 1

Then checked the Xcontrol Panel v.1.31 general setup CPX status and the ST Free Ram is 3982376 (Same as Above)

Then printed the document with no problems or error messages.

I am using OutBurst version 3.1 with the PageStream DeskJet drivers which makes page creation and printing much faster.

Also I was using PageStream in 256color mode 640 x 400 interlaced on a RGB monitor.

Then I rebooted the Falcon to TOS 4.04 without Geneva/NeoDesk.
And had around 11.5 megs of Free Memory before running PageStream.

After running, The about PageSteam dialog box reports...
Program Free Space 10104248
System Free Space 88936

However now I could no longer access any of my CPXs in Xcontrol v.1.31. But I could access the 4 Accessories I had loaded.

I had no problems loading graphics in documents, but I didn't try printing any of them out. I assume that they would though.

I have not found a solution to limit the amount of memory PageStream Grabs when running just TOS.
But the Limit Memory Option in Geneva does work for me with PageStream v.2.2B. And I can load programs after running PageStream.
I hope this rather long discription helps.

Hi!

I have a 1.5 foot long hard drive cable for my mega file 30.

I would like to have a longer one to use with my 1040STf.

Anyone have one available?

Jim

None, if you only have bootable TOS partitions on your drive and no bootable partitions for the TT SVR4. 'None' means the very first bootable partition is used for getting the bootloader code, 'TOS' means the first bootable _TOS_ partition is used.

Hi there.  I have the following atari hardware & software for sale:-

     Atari 520STFM with 1MB RAM
      & Autoswitch overscan board               35UKP O.N.O.
      & Original Discovery Pack Software & Manuals
      (STOS BASIC, First Basic, Outrun, Carrier Command,
      Bombjack, also 2 boxes of miscellaneous disks & games)

     14Inch VGA Monitor               20UKP O.N.O.

     Star LC20 Dotmatrix Printer           20UKP O.N.O.

     Alpha Data Hand Held B&W Scanner      25UKP O.N.O.
       + Touchup Software

Software:-

     Protext V6.5 (full package with manuals)   8UKP
     TCB Sound Tracker                      5UKP
     Master Sound II Software & Cartridge       6UKP

Games:-
     Frontier:- Elite II
     F29 Retaliator
     The Hollywood Collection (Batman The Movie,
       Indiana Jones & Last crusade, Robocop,
          Ghostbusters II)
     Flood
     Populous
     3d Construction Kit.
     Sapiens
     Epic
     Robocop III (the 3d game)
     Plus many others.  All games 5UKP each.
```

Magazines:-

80+ STFORMAT & Atari ST USER 15UKP the Lot

All prices in UKP.

Be careful! The DMA signals are not very well presented by the Atari hence the cables have to be very GOOD and quite SHORT. 18 inches is the max. recommended length - you may have troubles with a longer one.

>necessary commands B^{<

Mmmm .. I'd be happy to be able to confirm that, at least I would know where I stood. As it stands CDPLAYER only tells me that EITHER the device OR it's driver is deficient. I have searched for (and failed to find) a program which will 'diagnose' the CD device and tell me what its capabilities are. I have also fought through the thickets of the IBM web-site to try to find the device specs. but they only seem to have data on current mechanisms.

Ho hum, perhaps someone will turn up some data.

>Equally bad problems here. This is what I've done - can anyone pick holes in

I suppose you could try running SCSIDRV.PRG from the CBHD archive. It may substitute for the hooks provided in HDDriver.

```
>Running it under Magic I'm using a directory structure of:
>

>                        /XTENSION
>                                        SPINMAGC.XFS
```

>
>I've also got the generic SCSIDRV set up in HDDRIVER v7.04.

OK, that's just as mine is under MAgic 5.11 apart from:

1. I use CBHD so don't need to use SCSIDRV.
2. I have stuck my .BOS and .DOS in a folder of their own and changed CONFIG.SYS appropriately.

Ah HAAAAA ..... your METAXBS must NOT be a .PRG!!!! Rename it to .PRX.

>The CDROM is hanging off the TT's ACSI port connected via an AdSCSI host
>adaptor as ACSI 1 and the CONFIG.SYS looks like this:
>
>*BOS, C:\AUTO\SPIN_SD.BOS, A:1

Right. This gives you the CD as device P:

>Before setting the software up I connected everything and got IDCHECK to
>confirm the device was being recognised as ACSI 1 - it was.

So its not a 'Parity' problem and probably not 'Termination' problem
....

>Has anyone got any idea what I'm doing wrong? Or is it that the CDROM
>really isn't responding?   The problem seemed to start when I put the XFS
>in the extension folder. Could it be that?

It'll be that METAXBS.PRG, Harry.

36" cables have always worked well for me, provided they were quality
shielded cables (such as those sold by ICD).

Once upon a time was made a CDROM player unit (called CDROMROM or CDROM2)
that attached to the Atari cartridge port. The driver software consisted
of an auto program. My original disk with this driver vanished when the
unit was on loan.

Does anyone have this driver and could consider sending me a copy?

I would assume that the drive just doesn't support DDS (Direct Digital Sampling). Currently SPIN_SD uses a lookup table with manufacturer names to select the DDS method (if it is not SCSI 3 compliant). The next release of SPIN will probably a bit smarter in that area, but I would be suprised if this helps with a 3 year old IBM drive.

If is *does* support DDS on other platforms (Mac, PC), please raise the issue again :-)

Historically, Sanyo CD ROM drives seem to have some problems. As far as I
remember, I have been able to run one with SCSIDRV.PRG connected to
the TT's SCSI port. As you have a TT anyway, maybe you could try that?

Can some one tell me if the Atari st can be upgraded with a 1.44 floppy drive.
My problem is that I have to transfer Multiple files from a P.C. to Atari quite
often and as I can only do 700k+ with current floppy drive its taking yonks.

thank you in advance

hi there,

no problem. there are many emulators, but the differences between them
are causing problems. there are even freeware-emulators, as well as
commercial ones. i can�t make a suggestion which to use, in fact i�m a
falcon user, but your decision at least depends on the sort of TOS

software you�d like to run on the pc.

the emulators i know are:

Magic PC	by application systems heidelberg, germany
STEmulator	(available f.e. at Falke Verlag, Moorbloecken 17, 24149Kiel, germany)
Gemulator	???
TOSBOX	i think this one�s freeware and should be somewhere on the internet
TOS2WIN	available f.e. at aixit gmbh, huettenstr. 46, 52068 aachen, germany

you�d better try a freeware solution first....(i think i didn�t have to mention this...., ;-)), or ask for demo-versions.

surely there are people in this group who know better about emulators, so watch out for more info and have fun, greets -micha-

Yes, there is.
There are many emulators like MagicPC or Gemulator98, with them you can run Atari-Software in Windows95.

If you would like to run Atari-Software directly under Win95, you can use "Tos2Win".

Here are helpful internet-adresses:
http://www.aixit.com/tos2win/ (Tos2Win)
http://members.aol.com/ashinfo/index.htm (provider of MagicPC)
http://www.emulators.com/ (provider of Gemulator)

I hope, i can help you with that.

Armin

Hello All,
I have a C-Lab Falcon 030 with a Toshiba internal 2.5" 540meg scsi hard drive, and an external NEC scsi CDR-MV2 1x cdrom drive.
My problem is that when ever I boot my Falcon with the cdrom connected to the Falcon's scsi port, my boot partition gets scrambled and I end up having to rebuild the partition and reloading the files placed therein. I have tried 3 different external scsi cdrom drives and have replaced the cable all to no avail. Can anyone out there figure out what the problem is and let me know so I can rectify it and make use of my cdrom drive? Thanks! :)

The keyboard processor knows only two buttons, i.e. two inputs. The button you hook to the one is treated as the left, the button at the other input is treated as the right button. No more buttons are supported.

You can connect a serial mouse to a serial port, but I do not know the details how buttons are reported.

AFAIK they all use the same keyboard processor.

> What about the new Atari clones, do they even have an
> Atari mouse port?

Probably not if they employ PC keyboards.

Cheers Peter

Depends on what kind of adapter. The c't ACSI-SCSI adapter supports only two devices, that's tough.

I guess you won't call the c't adapter a true SCSI adapter ? ;-)

Cheers Peter

There's programs to check the troughput quite nicely, like NetMedic for
example. It's great for checking connections, but only available for Windoze
:(

I'm no expert, but the C-Lab Falcons have a modified internal
termination pac that needs to be removed if your going to connect
and external device (terminated) while you have your internal drive
connected. Look for three resistors poorly soldered near the external
SCSI connector and remove them.

Mike

FWIW, there is already such an adapter for the Amiga, called "Topolino" or similar. Since the only difference between Amiga and Atari mice are the pinouts (which is why most aftermarket mice are switchable between the two), anyone needed such a solution tomorrow could purchase a Topolino and wire up and adapter.

BTW, if you incorporate a switch into your device, you could market it to both Atari and Amiga owners, something the makers of the Topolino overlooked.

On the subject of third button support, it would be nice if support for the "fourth button" some mice now have (usually on the side, like the current top of the line Logitech mouse, and the newest version of the inexpensive Genius Netmouse), as well as scroll wheels. About the only way I could see to support that, however, would be to make use of the second joystick port for the signals (and either a custom driver or software written to spec would be required, of course).

It sounds like a heat-problem of the video-chip (I don't know at the
moment where he sits). Try a ice-spray. I f the problems disappears it is
indeed a heating problem and you can set on the chip a colding pece.

Topolino is a nice device, but at $40 it costs twice as much as an Atari mouse!

If there is any interest I have a 1040STe with 4 megs of ram, two B/W monitors and one color monitor. 2 50meg hard drives, a 3ft square box of original software (only disks and manuals) Must be hundreds of titles in the box. And lots of books about ST computers. A huge collection of START and Analog magazines. If anyone is interested in buying all or part of the collection, I'll photograph it and list the software titles on a web page or post the list here.

> Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI

things to check:
1) what is the SCSI id number of your CD-ROM?
2) is the CD-ROM terminated?
3) what CD-ROM driver are you using? (Meta-DOS, ExtenDOS, SPIN?)
4) what Hard disk driver software are you using? (HDDriver, AHDI,...?)
question 2 is probably the most important, and possibly the
cause of your difficulties.
I am not sure if your internal SCSI has to be terminated or not.
perhaps someone here has more info.

> ...

To use the MIDI ports you only need the right software (see your other message).
You could use your guitars if they were MIDI guitars, which is not the case with normal guitars (no plug).
I don't think it's worth while to amplify the ST Sounds. You could however connect your ST to any sound system via the monitor plug or special hardware.
A STE would be better for this purpose (has better sound and extra plugs).

I had my 1040st 1 meg in the shop. The tech says the motherboard is good, the keyboard is good the diskdrive is good. The power supply (as usual) is flakey and needs to be replaced. It runs fine once booted, but should be replaced. I choose not to do that. Make me an offer to offset my trouble of packing, box and shipping to you and its yours. e-mail please and thank you. sfpu@scfn.thpl.lib.fl.us

All 'real' programs come on 720 k disks, I wonder if Cubase or Notator still fit on one disk? Every Atari Shop should have it, they are the standard.
See the FAQ and FTP sites for other suitable programs I'm not up to date here.
You should anyway change your floppy drive to a double sided one (see above) and even think of adding a harddisk, because you may also want to save a lot of data when working with midi.
The floppy drives are standard, perhaps you have to configure it. Ask here if you meet any problems.
One problem that you will confront is that 720 K floppy drives are no longer available.
You can also use high density floppy drives but that will lead you to compatibility problems. I would prefer even a second hand 720 K floppy drive.

Greetings
Wolfgang

The voltage levels are not the problem, what he meant is that the signal
is inverted.

Cheers to you!

Nobody talked of CMOS here.
The question was if a TTL could drive a RS232 Line Buffer, and the
answer is yes. If it is recommendable or not is in the responsability of
the owner.
You are perfectly right that a converter would be far better than
anything perhaps working.
I saw this more as a technical dispute (see name of news group) than an
advice for users.
But I still doubt that you can destroy a CMOS with any voltage between
low and high supply voltage.

Wolfgang

Insert the three resistor packs says: remove the internal scsi stuff..
C-lab doesn't use the holes from the resistor packs for they internal
bloody scsi circus ?

Some have it so..

Not necessarily. Early machines did not have TOS in ROM. I do not know
about a 520 STFM, never heard about that model. If it really has a floppy
build into the main case, it's likely TOS is built in too, but AFAIK all
machines with built-in floppy are at least 1040 STs.

So the guy should switch it on and wait until some picture (not just the white
screen at the beginning), which might take one or two minutes without floppy.
Then, either it's a desktop (plain single-color with a white bar at the top
and two or three icons, or it's BOOT's request for a boot floppy, which looked

like a big picture of a disk drive and a floppy and a OK button.

Cheers Peter

Still the logic levels are inverted, so that doesn't help much.

Cheers Peter

I tried it once and it was no go. What the TT really wants to see are
the older eight or nine chip, "Non-Composite" SIMMs. Good luck
finding some...

The voltage _is_ the problem. If you can convert it to TTL levels, what about
and NOT gate ?

The 520STFM was basically a 1040 with only 512K of RAM. It was the replacement for the 520ST (with separate floppy) as the "entry" level model of the ST series in the U.S. It came out shortly after the 1040 ST.

On Fri, 8 May 1998, Peter Rottengatter wrote:

Aha. That model was never released on the german market.

Yep,- that was my first machine to. A GB model 520 STFM with room for another 520
Mb of ram. I got it in april 1987. And it was expensive compared to what they
charge for a Falcon or a Milan to day.

cheers Joergen

Probably not. Even some of the nine chip simms will not work. Check at Systems for Tomorrow. Kent got some more TT ram boards in stock and was able to actually test some simms before shipping them to me. My 16 meg board is now working fine.

MEGA 2 is now added to my site, Still working on the other links so please bare with me. Or you can get MEGA 2 by clicking on the links near the end of the message.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't. There are a lot of people who have not yet seen MEGA so get downloading there or over 200 articles on the 2 discs with a nice shall which anyone can use without any info at all on it.

There are many sections in this zine, Some or 1 off and are very interesting to read, It would be impossible to list them all so heres a quick rundown. True horror/ghost tales, STOS, Tesla, Electronics, jokes and humour, Dreams what they mean and stuff, get rich, UFO articles, stories, Anti car crime, Reviews, Returned questionnaires, Science, Black holes, and much more. Simply take a look and you will be amazed on what we have found for you. There should be something for everyone in issue 2. Lets here what YOU would like to see appear !!

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced. Anything you do will be included in issue 3 which is currently been done by the MEGA team.

I want to make MEGA "YOUR" zine, so tell me what you want and we will include that page in the next issue. Any ideas not matter who obscure or small they be, are more than welcome.

Can you suggest a good articles site, Something you may think could be of interest to other MEGA readers ? No matter what it is we would like to here from you. Just look at the area of topics we are covering, You name it, we will do it. Anything you may think could possibly help please mail me the links, If I use the site I will give you credit (of course) for giving me the site URL.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time. Get on the MEGA mailing list, or ask if you are already on it just to make sure (I may have missed you off for some silly reason).

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Everyone who has sent me mail over the last few weeks has not been added to the list. If you would like to be added to the mailing list then please re-mail me so I can add you to the list. Please check if you have requested to be added to make sure you have been added.

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

Issue 3 is really taking off now, We need your suppot now ! We have had good responce for MEGA but no one knows how they can help, First of all fill in the questionnaire. I will try to suggest a article that you can write about, you then simply write it and have the sortcut to fame in issue 3.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him. If you would like to send Lee mail, Send it to me but put "FOR LEE ROUND" in the subject box and I will be happy to pass it onto him. If your interested in UFO's or related stuff then request issue 2 of UFOST now, I regret it still has not been added to my site. Send me a mail if you would like a copy.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for MEGA Disczine issue 2.

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d1.zip

Not true. It changes from part to part, of course, but as a general rule CMOS inputs will accept a very wide range of input voltages as 0 or 1.

Just for example, I looked up the PowerPC 750 input levels. (Keep in mind here that it's a CMOS device which uses 3.3 V I/O, not 5 V.) It will accept 0 to 0.8 V as logic 0 and 2 to 3.465 V as logic 1.

> Trying to apply, say, 2.5V to such
>a CMOS input will cause it to draw excessive current, enough to
>destroy the chip !

Not at all. It is perfectly safe to apply such a level to a CMOS input.

>This is why CMOS only consumes power when switching, and why the
>power consumption increases with clock rate (switching frequency).

No, the true reason why CMOS consumes power mainly during switching is that changing the state of a CMOS gate involves charging or discharging gate capacitors on FET transistors (FETs have an inherent input capacitance). Once the capacitors have settled to their final voltage, current mostly ceases to flow and there is almost no power usage.

> and NOT gate ?

True. But if you spend two transistors and three diodes or whatever a clever circuit to convert the voltages takes, and add a NOT gate, then you've spend more than a RS232 buffer. Still you'll end up with a rather unsatisfactory solution in terms of driving power etc.

Cheers Peter

> Nobody talked of CMOS here.

People talked about 68901. There are CMOS versions available and I'd not be
surprised if they were used in recent machines.

But my main point was to oppose the statement

:> This is digital: If it's not high, it must be low, what else?

which simply isn't true in case of hardware. And I did not cite anything
else from your message did I ?

> The question was if a TTL could drive a RS232 Line Buffer,

Nope. I cite Jo's original message :

:> I know it's recommended to use a TTL-to-RS232 converter for the
:> Falcon's MFP serial interface, but I wondered if anybody has tried to
:> use it without. I'm going to connect a serial mouse, and I want to

An MFP might be NMOS, or CMOS, but definitely not TTL. And the question
was if it could drive the RS232 inputs of a serial mouse. The RS232 Line
Buffer was exactly what Jo wanted to avoid (which is not possible though).

> and the
> answer is yes.

It can drive the "TTL-side" of the buffer, of course. It cannot drive the RS232 side.

BTW there are CMOS versions of such buffers, an NMOS chip will even have trouble driving any inputs of such a thing.

> But I still doubt that you can destroy a CMOS with any voltage between
> low and high supply voltage.

You can. In case of more complex chips, the manufacturers build in protection mechanisms so strictly speaking it's not original CMOS anymore. I guess you haven't done much with CMOS ?

Cheers Peter

That's fine as far as it goes, but what benefit would I see between the two
and under what circumstances or software would allow me to use the Magic
setting?

I just got two ST's, 1 is a 1040STF and the other is a 1040STFM, what is the difference between these two?

I also got a SH204, but no cable, is the cable for this just a straight thru cable?

Lastly where can I get a mouse for the ST?

Thanks, Mike

Never heard of an STFM?????? It's generally accepted as the most widespread
model, the good old ST with integrated floppy and RF Modulator (from circa
1987 to the introduction of the STE). Anyway, STFMs all have TOS in ROM,
that's why I didn't mention it.

>
>So the guy should switch it on and wait until some picture (not just the
white

floppy.

Well, my pre-2.06 TOS machines have always booted with a blank white screen,
nothing else.

>Then, either it's a desktop (plain single-color with a white bar at the top
>and two or three icons, or it's BOOT's request for a boot floppy, which
looked
>like a big picture of a disk drive and a floppy and a OK button.

Never seen that, but then again, I've never seen any of the oldest TOSless
machines.

Cheers,
Nick

>Aha. That model was never released on the german market.

Yep,- that was my first machine to. A GB model 520 STFM with room for
another 520 Mb of ram. I got it in april 1987. And it was expensive compared
to what they charge for a Falcon or a Milan to day.

520Mb, well that's a lot, even by todays standards!!!! Not sure if TOS
supported all of it though ;-)

Cheers,
Nick

Ups,- that was a "minor" mistake. Natually- it was only 520 Kb. from the start.

:-)))

cheers Joergen

Hello all,
My name is Sam and I'm the one who sent out the CDRom Problems message a few days ago. Thanks to everyone who responded with ideas and suggestions. Unfortunately, I haven't been able to try any of the suggestions because my Falcon won't even boot now! :(When I turn on my Falcon, you can here the power supply kick on and the hard drive starts to boot, then it stops. When I disconnect the hard drive and attempt to boot from floppy, the only thing that comes on is the power supply. Can anyone tell me what to do so that I can at least get my Falcon to boot?
Getting desparate,
Sam

Hi

Im trying to locate Cubase (latest version) or Cubase Audio for the Atari Falcon.
It must be an Atari Falcon specific version.

Does ne1 have it to sell ?

If so what your asking price ?

Thanks

Andy

Hi, I'm using Pagestream 2.2 on my Nemesised Falcon, and I've got a problem. I tried to load up a 29k .IMG file of the Jaguar logo. I was going to print it out on my HP694c printer. What happened though, was that I got an error message saying that I was out of memory. This is on a 14 meg Falcon, with 11 megs free before I ran Pagestream. While in Pagestream, I went to the HD Free CPX under Xcontrol, and it showed that I only had 70K of memory free when running Pagestream. Quit Pagestream, and I have 10-11 megs free again. Anybody know what is going on? I even tried running Pagestream under Neodesk/Geneva with the memory flag set so that it couldn't grab all available memory and it still did the same thing. Thanks in advance...! ;-)

The "F" means it has a built-in floppy drive.
The "M" means it has a built-in TV modulator, making
it possible to display an ST LOW or ST MEDIUM
screen on any television (usually channel 2 or 3).

>I also got a SH204, but no cable, is the cable for this

>
>Lastly where can I get a mouse for the ST?

Check out the list of Atari computer dealers at
my web site:
http://www.tmisnet.com/~strads/hq/sources.html#Dealers

They should be able to help with a replacement
mouse and cable.

IMHO Atari ST (at least) does not have hardware provisions for 3-button mouse.
This "extra" pin is simply empty.

Bonjour,

Dans l'article <3566833d.13867428@news.zetnet.co.uk>,
Tony Greenwood, <paxton@zetnet.co.uk> a �crit :

��>IMHO Atari ST (at least) does not have hardware provisions for 3-button mouse.
��>This "extra" pin is simply empty.
��
��I believe the ATARI has 4 Mouse settings..well mine does...
��
��1=left mouse button
��2=right mouse button
��3=both mouse buttons
��4=nothing (deep man!)
��
��Detecting third mouse button simply replaces option 3...I think!!

Not with standard functions... It seems that GEM/VDI functions theoretically allow one button per bit of the returned word for the mouse-buttons state.
That is, if 3 buttons :
%000 -> no button pressed
%001 -> button 1 pressed
%010 -> button 2 pressed (makes 2)
%011 -> button 1 & 2 pressed (makes 3)
%100 -> button 3 pressed (makes 4)
and so on...

The matter is that it seems that mouse-controller doesn't seem to be made for using these capacities...
I had an optical 3-buttons mouse. As far as I could remember, pressing the middle button had no effect on 520 but was recognized on Mega STE. But the returned word was incorrectly set.
It was a long time ago, I can't give more details...

I wouldn't worry too much. The printer port is a bit weak, but it caused
problems only with older printers.
On the other hand you can have problems by connecting the plug,
especially on the printer side. This is not related to the computer but
to supply voltages and ground shields on the plug.
Additionally it is bad habit to connect anything while power is on but
the switch-box was made for avoiding that.
In your case I see neither of the two problems.
Greetings
Wolfgang

Hello Michael.

AFAIK the LAN ports of MEGA STE and TT are very buggy; nobody refers to them so I assume they don't work correctly.

Generally they simply are serial ports with other voltages. (You can switch between LAN and Serial 2 port on both machines). Perhaps with HSMODEM7 you can get it to work, but I doubt that the LAN ports are really Mac compatible.

Besides they are not faster than the serial 2 port (230400 bps), so high speed networking will not be possible.

That's all I know, I would appreciate any further information (including corrections to what I stated).

Greetings,
Carsten

In early years with the ST i do that exactly in the same way.
That works fine, but do not use the switch while the printer is working.

In this moment i had a HP 660 connected to one of my ataris..
The second machine (Falcon) had access to the same printer via MidiCOM.

Saves one cable and that switch, not the fastest way, but realy
easy to use. Works also fine for papyrus, CoMa and also..

I'm not sure that newer MidiCom releases can handle serial transfers..
Ask Harald Blees.. (ST <-> PC)

Regards, Robert

I have a Wizard 560 Atari/Amiga switchable mouse. The middle button does nothing on my Falcon. (I sure wish it had some useful function, such as a double-click or at least represent both buttons being pressed at the same time.)

Have you tried alvi? It should work on an 1 MB ST, even with JPGs larger
than 4000x4000 pixels. You can load 800x600 JPGs with 300 KB free RAM.

The official versions support only monochrome display, but works on all
ATARIs in all resolutions, all TOS versions, loads up to 32767x32767 pixel
large pictures (2.5 MB RAM required).

Next goodie: It's fast... (4...12 times faster than GEMView)

Have a look at http://www.sax.de/~haase/atari.html

Bad info: I stopped development on alvi because of nearly no registrations.

Greetings,
  Uwe.

It seems that X11 can use the third button as I saw a friend using this button on a falcon under Linux.

But he has a Mega-STE keyboard and not the original Falcon keyboard.
Perhaps these keyboards (and the TT-Keyboards) are quite different from others.

Regards,

Benoit

The Atari SVR4 Unix for the TT and Linux support the third mouse button.

Yes it'me, and effectively the third button work as a real third button with my
MegaSTE keyboard whereas, before, it doesn't work with the original one. So i
think
TT & MSTE keyboard are able to recognise 3 buttons mouse. I will take time to look
on TT keyboard datasheet this evening to confirm this information and eventualy
i'll
try to disassemble the 6301 code to check the existance of the third button
routine.

Where are you living? And what speed do you get running on a PC?
And what about the "magic sac", what speeds do you get?

>really Mac compatible.

I thought they were standard RS-422 ports as on Falcon, wich are fully RS-232 compatible, as they also are on Mac. Do 422 really have other voltages than 232?

>Besides they are not faster than the serial 2 port (230400 bps), so high
>speed networking will not be possible.

That's faster than what Mac AppleTalk uses I think, then again I'm not sure. Capsuling TCP/IP by AppleTalk (i.e. MacIP) isn't that fast, but it is still usable.

>That's all I know, I would appreciate any further information (including
>corrections to what I stated).

It is possible to use a-talk for Unix if you run a Unix, but that's not really Atari any longer ... anyway, what's needed here is only software, the hardware (AppleTalk-transceivers) are more or less just to plug in an go (if not the LAN-port, then the serial port). Anyone knowing more about this?

I found Nemesis to be to expensive so I made my own "Nemesis lookalike" for
something like 5�.
 (50mhz DSP, 25mhz bus/cpu, 50mhz FPU, 50mhz int. pixelclock, 39mhz
external ;-) (
 I changed my cpu to a 50mhz one a couple of weeks ago, and would like to
use 50mhz instead of just 25mhz!

 brag brag

(This was going to be a quick note ... sorry it ran so long. Just excitable, I guess.)

> I'm still amazed that something like this
> hasn't been mentioned here before though...

Well, they're busy working on the new machine, and I'm trying not to drool excitedly in public. Plus, I'm not really associated with the project, so it's hard to know just how much I should say.

I do know (via email) that the promised survey on the Wizztronics page will be posted Sometime In May, which is why I'm suggesting that the deadline for ideas and suggestions is drawing near.

Since I consider myself a "recreational programmer" (I know enough to get by, but not enough to create a sale-able program), I'm doing two things:

1/ Sending in suggestions to make recreational programming easier, both from a hardware standpoint and from a GEM/AES standpoint (since ease of use AND ease of programming causes system growth and acceptance), and
2/ Advising the experts I come across that their input is needed, right now!

The 680x0 architecture is already MUCH more efficient than the x86 architecture, and GEM ... for those who choose to use it ... is already MUCH more efficient than MS-Windows; so concentrating on ease of use and ease of program development is an important consideration at this time!

Since Microsoft's[s&m] house-of-cards[tm] seems to be nearing it's critical height, the availability of another stable, reliable operating system (TOS) and operating environment (GEM, MAGIC, et. al.) gives us an edge we haven't had in years. There's a slight chance we could overcome the dominant industry system, in much the same way Microsoft overwhelmed the prior dominant industry system (CP/M).

You may think your idea is "so obvious" that they can't help but implement it, but my passing reference to an "evnt_joypad()" call resulted in several postings and an email or two that said "How come they haven't done that yet?"

Just to be on the safe side, SUGGEST THE OBVIOUS!

In addition, Steve Cohen has stated for public consumption that he receives email suggestions daily, and that many of the ones he reads are "...brilliant!"

Just to be on the safe side, SUGGEST THE OBVIOUS!

Thanks for letting me ramble.

Greetings!

The answer, courtesy of http://www.optimized.com/tech_cmp/

The RS-232 standard doesn't define everything nor does it address every conceivable situation. There are three basic categories of issues related to RS-232:

1.Some engineering specifications are absolutely explicit.

A.Voltage levels: Voltage is referenced to a zero-volt ground and ranges from +15 volts to -15 volts.
<snip>
E.The purpose for each wire used in the cable: There are 25 wires described in the RS-232 standard. The purpose of each wire is explicit. Moreover, not all 25 wires are required to make a simple connection between two devices. Your personal data assistant (PDA) or even your wristwatch may have a tiny two-wire RS-232 interface that allows you to backup and restore data. Based on the requirements of the interface design, as few as two of the 25 lines may be implemented.

Like RS-423, the RS-422 standard defines a uni-directional interface for up to 10 receivers but the electronics are designed differently. Instead of referencing the data voltage level to earth ground, the data signal voltages are defined as the difference in voltage between a pair of wires. Because of the use of a "balanced" circuit, the problems of Common Mode Voltage differences are reduced. This requires one additional wire in the interface. The advantage of the more sophisticated electrical interface is that RS-422 can be used with data rates up to 10 Mbits/sec. That�s a significant improvement over the 10 kb/sec maximum data rate for RS-423.

RS-423 allows for distances up to 4000 feet but limits data rates to only 100 kb/sec for a maximum of ten receivers. The voltage levels are +3.6 to +6 volts to represent a binary 0 and -3.6 to -6 volts to represent a binary 1. The voltage levels are defined relative to an earth ground potential assumed to be zero volts. Consequently a difference in ground voltage levels will result in the Common Mode Voltage problem that will confuse the data values.

It seems to be a disk image for ST emulators. What you need is to make a floppy out of it either by;

a) Using a ST disk image writer on a PC (works with disks that are max 9 sectors 80 tracks)
b) Using STtoDisk utility on your Atari
c) get hold of some program to convert it to MSA disk image format, and then write it to a disk on an Atari.

Try look at sites about PaCifiST and other emulators, they have all the utilities.

You shouldn't need that, since the SCSI architecture is a daisy chain,
just start the chain with you SCSI adapter, then the HD to the adapter,
and the CD-ROM to the HD. You end the chain with a SCSI terminator and
you make sure the SCSI ID numbers are correct.

Cheers,
Nick

Hi!

It works indeed!

I have a TT keyboard on my Medusa and shortly bought an Alfa data 3-button mouse for Amiga. I had to switch 2 little jumpers and now it works...

Linux supports the middle button. Before that I had to set Emulate3Buttons in the XF86Config and press both buttons together without shifting the mouse. But that was messy.

If you have a 'normal' ST keyboard you can just connect the UP line of the Joysick 2 port also to pin 5 of the mouse port. That's it!

I know it's recommended to use a TTL-to-RS232 converter for the Falcon's MFP serial interface, but I wondered if anybody has tried to use it without. I'm going to connect a serial mouse, and I want to make it as simple as possible.

Just from a general design paranoia standpoint, I
always like to put an inexpensive "buffer chip"
(not necessarily a driver, just something cheap and
easily availabale) in a socket between the
hardware and the outside world. When static electricity
comes to visit from the Outside World, it's easy to
repair the damage since it all occurs in the buffer.

In this case, using the TTL-to-232 chip as the buffer
would be my vote for reliability.

I meant to ask this before, but...

In HDDRUTIL I can set a whole range of boot parameters, such as None, TOS, Magic, Unix, Net BSD and TT SVR4. What benefits do these ring and what drawbacks?

I run Magic but set the boot parameters to None, ecause i don't know what the consequences ae - good or bad....

This should not work. TTL low voltage is 0V, this is neutral state in
RS232 voltage. There low voltage is -3 to -15 volts.

Bye,
Carsten

But it is possible though. For example when using to Megafile 44 drives
(no sense in it, OK, but no problems with it).
But it remains one SCSI system, so you are still limited to 8 devices.

Bye,
Carsten

I've never taken part of this buffer hysteria, and my ST and Falcon are quite well ... the only problems I've ever encountered are loose ROM-chips and a dead harddrive ... but recently I heard about this unbuffered port stuff and I try avoiding any hot-swapping. If you plug everything in before you power anything up you're safe. If you feel you're still paranoid, buffer every single port except mouse, joystick and MIDI. Don't forget to put a little voltage peak-protector-thingie in the wallsocket and move to a bombshelter ;) The only foolproof protection you'll ever acheive is to take full equipment- and life-insurance ...

You can use the LAN port as what it is, a serial device. The RS-422 standard is compatible with the RS-232, and someone better correct me BIGTIME if I'm wrong, because then I must me stupid enough to get it working anyway. Anyhow, the only problems I've encountered is running HSModem highspeed driver at the same time as the serial mouse driver under MagiC ... but somehow I feel that's asking for trouble isn't it? Especially since the Mouse program doesn't recognice anything but Serial 1&2 and Modem 1&2.

Who has written the serial mouse driver Mouse (v25?)????
Will anyone make a newer version of it? (I would)
How can anyone come up with such a wonderful idea? THANK YOU!

Regards, K.Hampf

Basically this should be possible but you won't gain anything. A single adapter is sufficient to address all the devices.

Greetings,

I have the older style 4meg TT-FastRam board (CA400312) with three jumpers, and am interested in upgrading it so that I can used 16meg instead of 4. I am wondering if anyone has successfully modified their board using the instructions found at :

http://www.megacom.net/~q-funk/TT030/upgrade.htm

The documentation seems to indicate that this is an untested modification.

Any help would be greatly appreciated!

There is no neutral state 0V in RS232 definition, -3V to +3V is an illegal range that should not exist, anyhow you must pass it to switch. But astonishing enough it works in most cases if the TTL reaches 3V and supports more than 5V and less than 0V which is not necessarily so.

This is digital: If it's not high, it must be low, what else?

Greetings

Wolfgang

I have NetBSD and TOS (MiNT) on my TT. So, I set the boot preference to
NetBSD for it to boot into NetBSD and TOS for it to boot into TOS. If I
set the preference to none, it doesn't boot from the HD (this is due to
the boot loader AFAIK).

BTW, can anyone tell me where to get a 3-button Atari/Amiga mouse in the
UK?

Hi All.

I am having to sell my atari hardware:-

Atari 520STFM upgraded to 1MB ram & Autoswitch Overscan
Alpha Data Hand Scanner with Touch Up Software
Star LC20 Dotmatrix Printer
MONO VGA monitor for ST Hi res mode

Software includes:-

Protext V6 (lates version 6.5 iirc)
Touch Up Software
Frontier:- Elite II
+Other games 7 software

Plus 80+atari magazines & coverdisks!

The whole lot for 180UKP

Tel 0131 443 4226 (Edinburgh) or E-Mail

ceebti@cee.hw.ac.uk

I recently got a couple xtra ram deluxe boards. I installed one per the
included instructions, installed 4 1Meg * 9 80ns simms (they are 9
chip). I get nothing. If I reconnect the internal memory and remove
the xtra, all is back to normal.

Does anyone have experience with these? Does this sound like a case
where the simms are not compatable perhaps?

Any assistance is welcome and thanks in advance.

There is a lot of things that can be the problem, but with the two installations I have done, usually it is the connector that fits to the MMU PLCC mold exterior holes that causes problems. I use 100ns chips, so speed surely isn't the problem. I also have one set nine chip and the other three chip. Isn't there also a connector that goes on the Video Shifter chip? Double check to see that the MMU connector is pointing the right direction. One of my cards was missing the direction indicator, which made it tuff. From memory (mine not yours:) I think the MMU connector indicator points to your left while facing the machine, meaning the ribbon should exit to the right. Double check me on that with the manual.

Mike

Yes, that's correct. Also MidiCom had Romport interfaces to handle
the transfer by 170Kb/Sec. But that's only for Atari <> Atari.

>Is this correct? Is MidiCOM FD or commercial

It is commercial. Also the Romport interfaces..
You can use the normal midi leads, that's the cheapest way. (But slow)

Few month ago harald tell me that he had some drivers to connect
other computers over a serial link to atari machines.

Regards, Robert

What mean's the word 'hissing'
I don't know what's the sentence of this word?

A Hardware problem?

Regards, Robert   (english from the dictionary) :/

1. CONVENTIONS USED

- A, B, C, X, Y, Z = Firebuttons as marked.
- Li = Left index-finger firebutton.
- Ri = Right index-finger firebutton.
- U/D = Up/Down on joypad (the "D" button).
- L/R = Left/Right on joypad.
- Comma(,) = press the keys in that order like dialing a phone.
- Plus(+) = press and hold the keys at the same time in that order.
- Dash(-) = Slide across and into the keys in that order.
- Slash(/) = press either key.
- Parenthesis = Grouped keys are pressed while pressing other key(s).
- Moves:
  - T = Towards opponent.
  - Aw = Away from opponent.
  - DT = Diagonal direction down & towards opponent.
  - DA = Diagonal direction down & away from opponent.
  - UT = Diagonal direction up & towards opponent.
  - UA = Diagonal direction up & away from opponent.
  - <Charge> means to hold the direction for at least two seconds.
  - <Close> moves performed standing next to opponent.
  - <Not close> moves performed from 3-4 steps from opponent.
  - <In air> moves are done while jumping.
  - <Far> moves performed a good distance from opponent.
  - A star (*) after the button means it can be pressed repeatedly.
  - A carrot(^) after the move name means it's a death move.
- Pro-Controller buttons map to the standard controller as follows:
  - X = 9
  - Y = 8
  - Z = 7
  - Li = 4
  - Ri = 6

2. JAGUAR GENERAL

- Remove "PAUSED" Message (doesn't work with all games): 1+3
- Toggle Music on/off (doesn't work with all games): 0
- Customize Spinning Cube:
  1) Activation:
     - Pause + Option (during Jaguar Logo)

       - OR -
     - Hold Pause (when the spinning cube appears)
  2) Commands:
     - Size   = U/D
     - Spin speed   = L/R
     - Spin direction = 0
  3) Continue startup sequence:
     - If holding Pause, release Pause.
     - Option, or Pause, or any firebutton, or Reset (# + *)

3. ALIEN VS PREDATOR

- Cheats:
  - Activate "Hold that Fuji!" (during game play):

    (Pause + Option) + (1+3, 2+5+7+9) Predator laugh confirms
    - Commands:
      - Security Clearance   = Raise:Option+6; Lower:Option+9

    * Motion Tracker Toggle = Option+8
    * Recharge all weapons = Option+1+2+3+4
    * Shotgun toggle = Option+1
    * Pulse Rifle toggle = Option+2
    * Flame Thrower toggle = Option+3
    * Smart Gun toggle = Option+4
* Activate "Banana Stops" (*=STar, #=POund) (during game play):

  Step 1) Pause,Option,6,1+3
  Step 2) B,A,9,A,9,A "BANANA"
  Step 3) *,Option,6 "STOPS"
  Step 4) #,* "POST"
  Step 5) *,Option "STOP"
  Step 6) 2,Option "TOP" (Predator laugh confirms)

  * Commands (the same as "Hold that Fuji!"; see above). Also:
    * Level Select = Option+A (Up), Option+B (Down)
      (Up = 5,4,3,2,1, Pred. Ship, Alien Ship, Airducts)
    * God mode = Option+5
      (Invincible & auto weapons power-up. Must have ammo first)
* Freeze Alien Queen (inside the Queen's Lair):
  Save game, then reload. Queen will be frozen & can be damaged. She'll die when you unfreeze her by walking through entrance.
* Shoot Predators first (in the Predator ship):
  Before collecting the smart gun, use the pulse rifle or shotgun to shoot around (or at where you know Predator(s) will appear when you get the smart gun). You'll see the blood, and if you've used enough ammo, the Predator(s) will die as soon as you collect the smart gun.

4. BALDIES

5. BATTLEMORPH

- ⋆ Easter Eggs:
  - ⋆ Quake Weapon:
    Destroy most of the trees on all worlds of the first system.
- ⋆ Hidden Bonus Planets:

Cluster	Cloaker on	Bonus Planet	Bonus Item(s)
Zephyr	Peramer	Dyphor	Clip, Extra Ships(2)
Carmine	Aphelion	Adeptus	Clip, Extra Ships(2)
"	Sanctine	Camillari	Trees
Ferial	Tyran Tehr	Brockshear	Clip
"	Charnel	Kant Liur	Extra ships
Pan Alma	Shau Yen	Tantaul	Extra ship
Pyroxine	Alkelam	Isolmin	Extra ship, Flash(75%)
"	?	Borazine	Clip, Flash(75%)
Cygnus	Chalnook	Brichardii	Clip
Pernish	Walker	Reiss	?

---

6. BRUTAL SPORTS FOOTBALL

- ⋆ Correct the League Mode Bug (at password screen):
  RMVVKL343
  333VZ6387

---

7. BUBSY IN FRACTURED FURRY TAILS

- ⋆ Level Codes:

2 = 392652
3 = 458227
4 = 958936
5 = 739294
6 = 184792
7 = 812615
8 = 781367
9 = 126712
10 = 236721
11 = 673167
12 = 792323
13 = 672328
14 = 782389
15 = 672345

---

8. CANNON FODDER

- ⋆ Cheats:
  - ⋆ Regain Weapons (must have at least two men left):
    Split off another troop with no grenades or bazookas.
    (new troop will have dead troop's weapons)
  - ⋆ Display Map (during gameplay):
    # or 0 or ⋆

---

9. CHECKERED FLAG

- ⋆ Easter Eggs:
  - ⋆ Night-time Racing (at "Weather option") = 8,4,7,3

---

10. CLUB DRIVE

- ⋆ Easter Eggs:
  - ⋆ Planet Todd (during World Selection): 4+2, firebutton.
  - ⋆ Drop & Fixed Camera views / Debug (during gameplay): 8+6

---

11. CYBERMORPH

- ⋆ Cheats:
  - ⋆ Unlimited Ammo (at Control Options): 1+3+5+7+8+9, firebutton.
- ⋆ Level Codes:

Sector 1 = 1008
Sector 2 = 1328
Sector 3 = 9325
Sector 4 = 9226
Sector 5 = 3444
Unknown = 6009 (found on planet Codex)
(Bonus power-up planet = lower right)

---

12. DEFENDER 2000

- Easter Eggs:
  - Plazma Pong:
    Enter "Nolan" in any high score table to get an extra game
  - Flossie's Revenge:
    Enter "Ovine" in Defender Plus high score table. Start Defender Plus by pressing A (instead of B).
  - Warp Enable:
    Enter "Beest" in Defender 2000 high score table. During Defender 2000, press 3 to warp to the next level, and press 6 to warp to the bonus round.

---

13. DOOM

- Cheats (during gameplay):
  - God Mode = Pause, * + Pause
  - Very Happy Ammo Mode = Pause, # + Pause
    (all keys, weapons, ammo, armor, and health)
- Level Select (during gameplay):
  - Pause, [level #] + Pause (A button adds 10, B adds 20)

---

14. EVOLUTION: DINO DUDES

- Cheats:
  - Infinite Time (at password screen):

    - * Death Move^   : C + (U, T, U, T) <far>
      or C + (U, U, T)

21. MEMORY TRACK

- * Access Memory Track Manager (for those that didn't get or lost the instruction card): Hold Option while turning on Jaguar.

22. MYST

- * Passwords (press Option during gameplay):
    - * All Places of Protection Open:

```
hold:  B B B B C C B B A B      B A B C B A A A B C
  + :  5 5 8 7 2 7 0 0 1 7      # 6 5 6 3 0 3 7 5 7
```

    - * All Red/Blue Pages and White Page Collected:

```
hold:  A C A A B C C B C B      A A B B B C C B B A
  + :  5 1 5 4 # # 7 0 7 5      3 4 2 2 3 # 2 6 7 *
```

- * Easter Eggs:
    - * "Atari" Library: Enter May 22, 1970 6:30am in the planetarium. The immediate front of the (still functioning) library will now be the Atari building. Click up to see the Myst crew on the balcony.

23. NBA JAM TE

- * Cheats & Easter Eggs (enter at "Tonight's Matchup" screen):

3 Point Pup   : UDDLLRU
32X Doom Mode : ABCCBAABCCBA
Baby Mode   : BABUDLR
Big Heads   : UCA
CD Mode   : CDCDCDCDCD
Dunks Pup   : RLBABA
Fire Powerup : DRAABL
Flame Game   : ALLDRAABBL
Goaltender   : RUDDRU
Push Other Pup: DLRULLLLAB
Push Pup   : BRADARB
Quick Hands   : LRABRL
Shot % On   : DUDBU
Shrunken Heads: UUUBCAAAAAA
Slippery Court: BADABRRRRR
Small Ball   : RRRRRRBBB
Smurf Game   : ABCDDDDDDD
Speed Pup   : UUDDLRLLBA

High Shots : ULLLDRUABAAAD   Strong Men : RULRBDA
Offense Pup : AUBDBLR   Teleport Pass : DRRAADLLRB
Push Both Pup : DUDULLLLAA   Turbo Powerup : BBDDAAUL

- Team Substitutions (at Player Substitution Screen): D+C+A
- Get Extended Roster (as Select Screen appears) : 1+5+9
- Defeated 26 teams (as Select Screen appears) : 2+4+6
- Defeated 27 teams (as Select Screen appears) : 4+7+8
- Story (at attract mode roster) : L,1,4,6,9 from Pad 0
- Adisak Attack : Extended Roster + Baby Mode + Wait

* Hidden Characters: Tournament mode should be off. Enter at the initials screen. Each initial must be entered with a "code", which is Option + the listed button. The N-button is any button with or without Option; i.e., to play as Hugo, enter "H" with Option+A, "G" with Option+C, then "O" with A, B, or C. '[' = space.

24. PITFALL: THE MAYAN ADVENTURE

* Easter Eggs:
  * Classic 2600 Pitfall:
    1. At the main menu, select "Info", press the C button 26 times, then press Down.
    2. Or at the start of the "Copan" level, go forward, jump on the 'tongues' to get to the very top platform (2 tongue jumps, then 2 ledges up), then do a running jump to the left to land on the ledge with the 2600 version scorpion. Kill the scorpion and enter the door to a ledge with another scorpion, a lock, and silver bar. Kill the scorpion, get the lock, go left to hit the wall, jump up & down till catapulted in the air. Go right while in the air and land in a small room with a colorful vortex. Enter the vortex.

---

25. POWER DRIVE RALLY

- Cheats:
  - Freeze/Pause your opponent : 6
  - Un-freeze/un-pause opponent : 9

---

26. PRIMAL RAGE

- Cheats:
  - Activate Cheat Menu (during opening "Jungle Scene"):
    L,L,R,R,L,L,R,R,L,L,R,R
    (Note: these have to be done very quickly and it may take several attempts till you get the new "Cheat" item on the main menu.)
- Easter Eggs:
  - Alternate character colors (at character select screen):
    - Original Recipe = (HQ)
    - Old Alternate = (HP) or (HQ + HF)
    - Weird #1 = (HQ + LQ)
    - Weird #2 = (HQ + LF)
- Hidden Moves: Some of these were already listed in the manual.
  HQ, HF, HP, LQ, LF, & LP refer to your button settings/config.
  - Armadon
    - Bed-0-nails : (HF+LQ)+(D,U)

  - Scorpion Sting : (HF+LQ)+(T,T) <close>
  - Petrify^ : (HF+LF)+(Aw,Aw,Aw)-(HP+LP)+(T,T)
  - Shrink & Eat^ : (HF+LF)+(Aw,Aw,Aw)-(HP+LP)+(D,U)
  - La Vache Qui Rit^ : (HP+LP)+(Aw,Aw,Aw,D,T)

      - Chomp a Human : (HP+LP)+(D-T-U)

27. RAIDEN

- Cheats:
  - Infinite Lives and Bombs (at first boss):
    1+4+7+3+6+9+Option ("Extra ship" sound confirms)

28. RAYMAN

- Cheats (entered only at "hands assembly" intro sequence):
  - All powers & all maps = 1,3,5,7,9
  - 50 lives = 5,1,5,2,5,3
  - For both cheats, enter one code, wait until the demo game, press any number, then enter the other code at "assembly" intro.
- Easter Eggs (entered only at "hands assembly" intro sequence):
  - Sound effects toggle = 8 (during gameplay)
  - Credits screen = 2,5,5,2
  - Rayman "Breakout" game = 1,3,6,4
    (gives unlimited continues, upon winning)
  - Rayman "Razzberry" = press & hold Option (during gameplay)
    ("can be used to scare away the Scavengers in the Dream Forest world - although it's probably quicker to just punch them.")
  - Various dedications:
    0,0,7,*
    0,1,0,2,7,1
    1,2,3,0
    1,2,4,5,7,8
    1,5,9,#
    1,5,9,*
    1,5,9,0
    2,1,1,1,6
    2,2,0,4,7,3
    2,2,7,1
    2,7,2,6,9
    3,4,0,8,0
    3,4,4,7,0
    4,5,6,8
    9,3,1,0,0
    9,6,2,7,2

29. RUINER PINBALL

- Cheats:
  - To continue game with the same Defcon (in Ruiner) or same spells cast (in Tower) press at the "Game Over" sequence: 7 or 9

30. SUPER BURNOUT

- Cheats:
  - Turbo Speed (at title screen): 1,9,6,7,2 (musical beep)
    (Note: Automatic transmission option must be active. When bike's speed reaches 175mph, turbo accelerate by pressing C or the firebutton configured for "nothing". Top speed is 343mph and speed records are not acknowledged or saved.)
  - "The Punisher" bike (at title screen): 2,1,7,9,4 (musical beep)
    (Note: "It's a high acceleration, high grip, fast bike. You can toast all previous lap records especially with the turbo. It's basically just the best bike!!")

31. SYNDICATE

- Cheats:
  - Reload all weapons for free: save game then reload game.
  - For $100 million, use company name:
    "ROB A BANK", then your own company name
  - All missions, weapons, money, use company name:
    "TO THE TOP"
- Easter Eggs:
  - Speed up game clock (20X), use company name:

```
            "WATCH THE CLOCK"
----------------------------------------------------------------------------
32. TEMPEST 2000
    * Cheats:
       * Activation (at main menu)     = 1+4+7+A ("Excellent")
       * Commands (during gameplay):
          * Skip to Next Level      = Option  ("Outta Here")
          * Enable Warp Bonus Round = 6       ("Warp Enabled")
    * Easter Eggs:
       * Enable Rotary Controller (at Game Option menu):
            Press Pause on both controllers ("Excellent")
       * Web Rotation (during Web Select screen):
          * U/D = Web level
          * L/R = Rotate toggle
       * Invisible Web:
            Start any Tempest Plus game. Hold down Option (cheats must be
            active) until you get to the rainbow levels. The web will be
            invisible during the rainbow levels only.
       * Pause Bug:
            At the end of the Bacon/Jupiter River bonus round, press Pause
            just as it switches back to the main game (after approximately
            two & a half pulses of the "Excellent!" graphic).
       * Secret Sheep:
            At the first "Jupiter" warp level, press pause, select music
            volume, and wait. Late in the track, you'll hear Flossie and the
            other sheep engaged in conversation.
----------------------------------------------------------------------------
33. THEME PARK
    * Cheats:
       * All shops & rides:
            Sink all your money into shops research, then wait until April,
            two years later.
       * Low Cost Super-ride:
         When laying a track ride, first do the world's smallest track
         (something like this:)
                   00000
                   0   0
                   00000
                    && <--Gate
         Then open it and immediately close it again. You can edit it now
         and make it huge and you'll only be charged for the first, small
         ride.  One disadvantage: You will not win the "Biggest, tallest
         etc." ride of the year come awards time.  Depending on how long you
         want to run your park, it may be better NOT to do this.
    * Easter Eggs:
       * Adjust Screen Position (at any time): Option + L/R
----------------------------------------------------------------------------
34. TREVOR MCFUR IN THE CRESCENT GALAXY
    * Cheats:
       * Activation (at title screen):
            1,1,9,3 (No confirmation) (11/93 = "Trevor's Birthday")
       * Commands (use controller #2 during gameplay):
            A = Speed up foreground scrolling
            B = Slow down foreground scrolling
            C = Fire special weapon without depleting inventory
            1 = Power up gun
            2 = Cycle through bomb power-ups
            3 = Mark other moons as completed
            4 = Toggle ship invincibility
            0 = Cycle through sound effects
            * = Play selected sound effect
            L/R = Background scrolling speed
            Option = Skip to next stage
____________________________________________________________________________
35. TROY AIKMAN FOOTBALL
    * Cheats:
       * Score 2 extra touchdowns:
            After you score a touchdown, press Option and call a time-out.
            You get 6 points and the ball at the 1 yard line. Then repeat.
            You can score up to 3 touchdowns per down (18 points).
____________________________________________________________________________
36. ULTRA VORTEK
    * Cheats (at options screen):
       * Uppercut Annihilations (during "Annihilation Time"):
            Uppercut opponent (D+Punch). Works with any character only on
            the "Stoned Poseidon", "Hell's Kitchen", or "Temple of the
            Vortek" stages.
       * Anvil Annihilations (during "Inner City Chaos Stage" only):
            Do this far from opponent so you don't get crushed by the anvil
            that drops from the sky. D, D, D, then:
             * A (for Lucius, Dreadloc, and Skullcrusher)
             * B (for Volcana and Grok)
             * C (for Buzzsaw and Mercury).
    * Easter Eggs:
       * Enable speed selector option (at title screen):
            1+5+9  ("fight" confirms)
            (can select "normal" or "turbo" speed)
       * Hidden Backgrounds (during background select screen):
          * Subway Passage: *
          * Hidden Palace : #
       * Hidden Characters:
          * Carbon: Must be on Hard or Killer level, one-player mode,
            "Earthquake Zone" stage, win a double perfect. Carbon will be on
            "Subway Passage" stage. Easy way to get a double perfect in
            "Earthquake Zone": at beginning of game, beat the first opponent
            then lose & continue for the others until "Earthquake Zone",
            then get in one hit and block until the timer runs out.
       * Enable voice modem (at title screen):
            9,1,1  (emergency on phone pad)
       * Test Mode (enter at the "EYE"):
            1+2+3+7+9+Option
       * Change Music/Sound FX/Volume (in the middle of a round):
            Pause, A/B/C
    * Hidden Moves (^ = Annihilations):
       * Buzzsaw
            * Airgrab & Slam         : U, D + A <close>
```

  - Bolo : T, T, C <far>
  - Gut Grinder : Aw + A* <close>

37. VAL D'ISERE SKIING & SNOWBOARDING

- Cheats:
  - Infinite chances (during time results at end of race):
    Press Reset (* + #), then choose play from main menu.
- Easter Eggs:
  - Secret menu (at the mode select screen):
    4,0,8,5,7,4,1,4

38. VID GRID

- Cheats:
  - Instant solve (during gameplay): (4+7+8) + B

39. VIRTUAL LIGHT MACHINE (VLM)

- Easter Eggs:
  - External Input Mode:
    Close the drive lid without a CD and press A+*+#
  - Freeze Swirls:
    Go to effect 9-1 (or any other hold-down-B-button effect). Hold down B to make the swirls appear. Release B & quickly press 1-1 (or any other non-B-button effect) before the swirls disappear. Return to effect 9-1 (or any other B-button effect). Now the swirls are in the state/size they were in when you left effect 9-1. Move the joypad around & notice the swirls will stay without pressing B. They will stay frozen in the other B-button effects. To cancel the freeze, press B.
  - Spectrum Trigger Configuration Menu:
    In VLM mode: * + 0 + 1 + 3
  - Effects Configuration Menu:
    From the Spectrum Menu (see above): U,D (8 times).

40. WHITE MEN CAN'T JUMP

- Dunks list:
  - Preppies (wearing sweatervests with logos):
    Jules, Mace, Dr. Ed, O. G., Titan, Gruff
    DD, U, R, UD, RL
  - Women (women :) :
    Stress, Wisp, Rio, Sully, Hail, Twitch

```
             LR, LL, R, DU, DRU
        * Arm Outs (dribble with the other arm out at a 45 degree angle):
             Freaky, Eggman, G. Love, Stomp, Smack, Grip
             LU, RR, L, DU, ULD
        * Belly Rubbers (when dribbling towards you they rub their bellies):
             Saber, Hack, Burger, Rabies, Van, Fence
             LD, RD, L, DD, RUL
        * Handshakers ("These guys are hilarious! They sort of "groove" while
          they dribble.  In profile when they're dribbling they look like
          they're offering to shake hands."):
             Rush, Scrape, Tower, Slag, Goose, Skin
             D, DU, UU, L, RDL
 ____________________________________________________________________________
 41. WOLFENSTEIN 3D
     * Cheats (during gameplay, unless otherwise noted):
        * God Mode           = 4,6,6,8
        * Full Inventory     = 4,9,9,6
        * Next Level         = 4,7,8,6
        * Previous Level     = 4,6,9,6
        * Floor/mission menu = 1+3+7+9 (at main menu)
     * Easter Eggs (during gameplay, unless otherwise noted):
        * Music Menu         = # (at "Ball" title screen)
        * Refresh Info       = 4,8,8,7
 ____________________________________________________________________________
 42. ZOOL 2
     * Cheats (at options screen):
        * Infinite health               = 1,1,2,7,5 (Rooster sound)
        * 99 Lives                      = 3,1,9,6,5     "      "
        * Bonus Rounds enabled          = 3,1,8,6,7     "      "
     * Level Codes (at options screen):
        * Bulberry Hill first stage     = 7,7,7,4,9 (Rooster sound)
        * Tooting Common first stage    = 8,8,5,6,3     "      "
        * Snaking Pass first stage      = 3,3,6,6,6     "      "
        * Mount Ices first stage        = 1,1,9,6,8     "      "
        * Mental Blockage start         = 9,1,2,6,6     "      "

Thanks for the various replies (including one by private email). All correspondents have suggested that it's probably ok to go ahead with the switching.

I tried it last night (computers on, printer off) and so far everything's okay.

John

John, it's nothing to worry about it's somewhat normal. Depending on how old it is. On the early models it was a problem but on the later ones it wasn't as noticeable. I got mine in 95 if I play for a little while their's no problem but if I play like AvP for about 2 to 3 hours I can hear it up to about 2 to 3 feet away. If you go to the Jag FAQ it will tell all about it. Plus you can get all the cool cheat codes.

Hope this helps

Hi Folks,

I'm trying to get my Falcon to talk to a 2Gb hard-drive. It's an IBM DORS32160, and I'm trying to format into three roughly equal partitions. I need them to be this big to use as a CD Recorder image (Soundpool's CDRecorder Pro is a doddle to use), a trach assembly for my own recordings and as a 8-track D2D area.....

I'm using CBHD 5.01, though experiments with a friends copy of HDDriver 6 produced the same problems. If I partition it three ways I can see the partitions, the drive is detected OK at boot, but I can't get into them. When I repartitioned to 5 x 400Mb partitions I could get in OK, so it seems I have some sort of >512Mb partition problem with the OS.

I've tried to install BIGDOS, but although all the normal drives are OK, I still can't get into the big partitions. It asks me a question about <<media>> and then the machine hangs....what should I be doing, am I using the right program? it's BIGDOS 0.3 BTW, I found it at UMICH....

Hi FOlks,
Is this thread to do with connecting a mouse to the LAN port of a Falcon? I for onee would love to know if that uis possible as the LAN on mine does very little apart from allow Roy GOriunig to experimetn at group meetings with networking our two Falcs together, leaving me offline for three days because he didn't pout the STiNG config back properly....:-0 If fitting a mouse to this port would avoid such occurences in the future then I for one would be a happy man..

Any ideas welcome....I can't put a mouse on the MIDI or Modem ports cause I use them all the time for MIDI and Modems.....

I have a selection of Atari ST titles for sale.

This List Updated 2/5/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be responsable for in accuracies.

Mike, I tried to email a response but it got bounced...

I got 3 boards for 3 machines. I tried one of the other boards and all went flawlessly. Maybe I didn't have it seated right, maybe the board is bad, maybe it is "MES" (mysterious electronic stuff). I'm going to try the first board in another machine and then try to exchange it for another. Anyway, I really appreciate the reply.

Is anyone has a 600 dpi driver for PageStream 2.2 ???

No matter the kind of printer. It must have 600 pdi of resolution.

Thank's

Bob

From: mb@tos.pl.net (Mario Becroft)
Subject: Middle mouse button, how reported?
Date: 1998/05/02
Message-ID: <7CGXCEZ@tos.pl.net>#1/1
X-Deja-AN: 349525032
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.programmer,comp.sys.atari.st.tech

How is the middle mouse button state reported by the keyboard processor?
According to the compendium a relative mouse packet header byte reads as
follows:

0xF8 - No buttons pressed
0xF9 - Left button pressed
0xFA - Right button pressed
0xFB - Both buttons pressed

How is the middle button reported?

And can anyone tell me on which machines the middle button works and on
which it doesn't? I think someone mentioned before that it works on the
Mega STE but not the ST. What about the TT, Falcon, STacy, Mega ST or any
other machines? What about the new Atari clones, do they even have an
Atari mouse port?

Thank you for your assistance.

```

Additional info (if anyone is interested) I did a visual inspection of all the parts and noticed the pins in the IDC connector on the MMU board were bent "wrong". I disassembled the connector and sure enough, all of the pins were bent (as though the connector moved when being assembled.) I bent the pins straight, reassembled the connector and have not had a chance to try the board yet. (Hoping for the best)

I have the following Atari ST manuals in mint condition, free to whoever wants them:

- Internals
- GEM Programmer's Reference
- Tricks & Tips
- Graphics & Sound
- Peeks & Pokes
- Introduction to MIDI Programming
- Disk Drives Inside & Out

The only condition is that you pick them up personally from Quorn (near Loughborough, Leics.)
Email me if you want them, suggesting a date and time.

Sorry, I thought I had mentioned that; yes I have tried.

>
>[Please don't bother sending me copies by mail, my newsfeed is fine]

Okey:)

Originally I tried the CD-ROM with HD Driver v3.1 and the translator supplied by System Solution, now using that combination caused a lock up at boot time; but when I used it with the demon version of HD drive 7.? I could get everything acknowledged but kept locking the hard drive when I accessed it.

I have tried using the original translator but using the ICD Boot 6.5.5, I can access the hard drive but, although the CDR is acknowledged it keeps coming back to drive not reponding! This happens with & without termination in all combinations! The hard drive does boot:)

Now, if I change the adapter and use the Link II, everything is reversed, I can get access to the CDR but no safe access to the hard drive; all the file info is out e.g. 88769149149127647219 bytes used in, need I say more. And the hard drive will not boot.

Running the ICD hd partition program, when the CDR is attached it can't come back with number of heads etc. I don need to use termination when using the ICD adaptor.
Cheers! for now
Steve

Could be a combination of both:). We use the term "FM" at work, but it
isn't repeatable here. If you decide to add a speeder, I have a nice
document wrote by some of the SST people on what mods improve
performance and reliability (actually, they work well with a 8Mhz
machine too).

It's got me beat I'm afraid, the last thing I can try (and you've
probably already checked it a million time anyway) is to make sure your
HD driver is set to ignore the SCSI ID of the CD drive.

I have an Atari 520 ST, which I upgraded many years ago to 1Mb of RAM,
I have a hard drive and DOS emulator. I haven't used the Atari in a
long time, my son uses it for games.

My son and daughter are now very heavy into music, they both play
quitars. What is it I need (hardware and software) for the Atari to
take andvantage of it's MIDI ports? Is it possible to attach the
quitars to the computer and enter quitar music tracks etc, can the
computer play the quitars? Is there a speaker/amplifire system
available for this system?

Is it possible to pick up any of the stuff I need in the Toronto,
Ontario Canada region?

thanks in advance..............

I don't get this affect with 'none'. I guess it's no big deal either way, so
I may as well set it to Magic...

JDC> BTW, can anyone tell me where to get a 3-button Atari/Amiga mouse
JDC> in the UK?

I got my Optical Mouse from Golden Image UK Ltd in Wembley, though it was a
long time ago...:

Ok, I've got a 520STfm with a 2mb upgrade card and an interesting TOS 1.0-1.4 switcher, that I want to move over to a MegaST2. Using knowledge gained from upgrading a different 520ST to 1mb, I managed to rip the chips off the memory upgrade card, and put them in the mega along with capacitors next to each chip, and three resitors at R71, R72 and R74. Seems to work, (4mb, maybe I can get a usefull MiNT setup now...) but I just want to be sure I didn't forget something thats gonna make it explode later...

The TOS switcher is rather interesting, it uses a method I've never seen mentioned before... It uses custom burnt chips which are set in the sockets with pin 1 pulled out. They all have pin 1 strung together, with a resistor (brown black red gold, too lazy to dig up my electronics notes...) connecting pin 1 to pin 15 on one of the chips, as well as a wire with a switch connecting all the pin 1's to ground. When the switch is open, you get TOS 1.0, when closed, you get 1.4.

The problem lies in that the switchable TOS uses a six-chip set, but the mega has the stock two-chip TOS 1.2. The switchable TOS has chips labeled U2 through U7, but the mega has sockets labled like this:

U4 LO-2   U3 HI-2
U7 LO-1   U6 HI-1
U10 LO-0   U9 HI-0

What order do the chips fit in the sockets? And what magic jumpers do I have to set to make it use six chips instead of two?

: and an external drive at the same time

I suspect that this is a problem with either:

1. SCSI Termination (either in the Stacy, or on the Stacy Hard Disk)

or

2. Device ID conflict

i have not figured out any termination inside the stacy
as it appears the internal host can only support one device
and know all about device no's

the stacy and the mega ste have two seperate scsi busses
my next thought is that there is a conflict between the internal
host and the external host i have been trying with the translator
and had a mail from a guy using the link 11 who seems to be doing what
i want

i have one on order

Mike, I tried it and no go. Oh well. I got the 2nd machine and 2nd kit
up and going. Hopefully I can still trade the 3rd. (or replace the
idc connector at my leisure and have a spare.) Oh, MES usually doesn't
reffer to "stuff." Grin If you ever get that doc. online, I'd love to
read it. Oh, my main machine has a Tiny Turbo in it now too.

Thanks for the assistance.

Hi all

How can I attach a PC or ST mouse to the MIDI or LAN Port?,
I know Chris Crosskey has asked about the LAN, Would
Mouse Tricks help me out here? as i would dearly love to have
a mouse plugged in on the back of my falcon and not somewhere
i keep ripping you plugs, I woul still like to use my modem though
and if possible avoid the midi system as i play alot of midi games
but still if you can attach a PC mouse to the Midi then i'd
be grateful if someone could tell me about it..

Also does anyone know how i could make an st/amiga mouse work on
a PC?

thank in advance

Ian Norton

If you are using a manual switchbox, it is risky. If you want to play
it safe, either switch only while the computer and printers are off,
or get an electronic switchbox. ComputerGate International
(http://www.computergate.com) sells a suitable switchbox (catalog
#SB2502AU) for only $6.95. I have noticed Wal-Mart (do you have those
in Canada?) sells a similar one for about $10. No risk to your
machines, and automatic switching, to boot.

X-MimeOLE: Produced By Microsoft MimeOLE V4.72.2106.4
Newsgroups: comp.sys.atari.st.tech

For those of you who have not seen the best disczine around send a E-mail to
me and request issue 1 or 2.

If you have seen MEGA why have you not supported this new zine. There are
lots of you out there who must of liked something in it. But you don't tell
us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas
of your own. We need your support NOW. The more support we get the faster
MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We
need to know that people are reading it and liking it, There would be little
point in producing a zine if there is now one reading it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

yes of course, it is an atari ain't it... lol
ok use a ICD to scsi controller
then put the cdrom (scsi)
and the adaptec controller (scsi) on the scsi chain
remember the termination of a scsi chain.

ok the set up looks like this

```
atari
     ICD  (dma>scsi)
     cdrom (scsi
        adaptec (scsi) this goes from scsi to mfm  or rll
```

I use this set up all the time
the adaptec board I use is a 5500a
which allows 4 mfm hard drives..
You do know the limitations of the hd size by tos 1.0 and 1.2
?

well you can use ICD's interface and a Adaptec 5500a
ok the ICD interfaces to scsi and the 5500a interfaces to mfm  for the
drives... so you could put the icd>then chain the CDROM and then chain the
5500a controller together..
looks like this

Atari>ICD-----cdrom
                  \----adaptec 5500a
                                                   \--------hard drives
the adaptec device is a scsi to mfm
there are also  scsi to rll

Hello you all!
My Atari Falcon 030 is kind of damaged. It�s like that:
For four weeks the screen starts to change. At first only some little stripes but with the time they increase and after one minute the entire screen was full with those little (horizontal-)stripes.
I paniced and switch it off. Some minutes later I turned the F030 on again but after one minute the same goddamn stripes. Then I turned him off for three weeks.
After that the F030 worked. But after some weeks, yesterday, the same problem.
Can anybody help me???

I have heard of this happening when the power supply is about to fail
:-(

You could check that the connection plug of the PSU to the motherboard
is OK - it may be dirty/misplaced.

I have two PCs with Windows 95 and 10 megabit ethernet interfaces. I would like to be able to connect these two machines and my TT together.

I use MiNTNet on the TT, which comes with drivers for a number of ethernet cards. Assuming I can find such an ethernet card, how would I go about connecting the machines together? (I know nothing about ethernet.)

It appears that Windows 95 supports TCP/IP, so I guess I could use TCP/IP over the ethernet to link the three machines. Is this correct?

Will the ethernet connection be just another network interface, like the SLIP and PPP that I use already?

```

: and if possible avoid the midi system as i play alot of midi games
: but still if you can attach a PC mouse to the Midi then i'd
: be grateful if someone could tell me about it..

You can connect a common serial mouse (I'm guessing that's what you mean by "PC mouse") to the serial port (the LAN port is a serial port). You can not connect an Atari mouse to a serial port without some extra hardware. You can not connect any kind of mouse to the MIDI port without extra hardware.

: Also does anyone know how i could make an st/amiga mouse work on
: a PC?

Only if the PC has a bus mouse connection. If not, then you would need additional hardware.

Looks like a heating problem. How's the weather in your area ?
Is there other problems than video or the falcon continues running normaly (except
screen) ?

If this is the only problem, you could fix it putting a cooler on the video ship,
under the 2"5 HD.

If not, bring it to a specialist.

Regards
Eric

>I am having terminaison problems with an EZ Flyer and an STE 4 megs
>using ICD link. Seems it needs an EZ135 before and an ZIP after to
>work properly..

They are all need +5V (TermPwr) at Pin 38/Flatwire, Pin 25 round cable (DB25)...
Without TermPwr your ZIP, ZIP+ or EZFlyer can't terminate the SCSI BUS.

They are all have an active internal termination.
(But no TermPwr..) ;/

Cheap:
Fuse of 1Amp and a simple rectifier (diode) from +5V adaptor +5 psu
to Pin 38 SCSI connector..

```
                   Fuse (1Amp)     Diode
       main +5V ---######----------->|------o Pin 38 Flatwire.. (Pin 25 of DB25
cable)
```

But watch out the layout of your Adaptor..!!!
That will not work with ALL adaptors..

You need a 'solder licenze' ;-)

Expensiv:

Add a external hard drive, switch thre `TermPwr' jumper of
this device to 'on' , your BUS will work well.

FIRST:

Before you do anything..
Take a voltchecker, check pin 25/38 for +5 if your adaptor is on..
(4.5V looks ok, deeper as 2.3V is nothing)
Think before you do anything..

Note:

Use all parts to your own risk :->
If you can't modify your hardware, ask a friend..

Regards, Robert

Hi everybody!
The is Sam Ferrer and I'm about to pull out what little hair I have left! :)
Every time I boot up my falcon with the cdrom drive connected and powered on, the data on my boot drive gets scrambled and I have to rebuild my boot partition and reload the software on that partition. The cable has been replaced, and I've tried 3 different scsi drives. Does anyone out there have and ideas/suggestions as to how I can fix this problem?
Thanks,
Sam :)

It's a direction bit on joystick #1.

>And can anyone tell me on which machines the middle button works and on which it doesn't? I think someone mentioned before that it works on the Mega STE but not the ST. What about the TT, Falcon, STacy, Mega ST or any other machines? What about the new Atari clones, do they even have an Atari mouse port?

I know it works with the TT.

For those of you who have not seen the best disczine around send a E-mail to me and request issue 1 or 2.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

Rather than try and explain it here, take a look at the "Linksys How to Build a Network Guide" at:

http://www.linksys.com/support/faqs/howbuild/default.htm

It should be good at least for the cabling info...

>It appears that Windows 95 supports TCP/IP, so I guess I could use TCP/IP
>over the ethernet to link the three machines. Is this correct?

Hmmm, sorta. I have a similar set up as to yours, two Win95 boxes, as well as an old 386 I threw onto the LAN because I had an extra ethernet card. I'll ignore that one... I (or anyone) could go on forever about tweaking Win95 networking... It's rather complex, not sure how to explain it, but heres a quick (heh) overview of what you'll want to do:

Once you get cabling figured out, the first thing to do is set up Win95's built in networking. Its main use is for file/printer sharing, and network gaming... This is easy, since windows will walk you through it when you install the drivers for the card. Double click on Network Neighborhood and you should see the names of all the machines on the network. If you don't, somethings wrong... ;) Now make sure you have file sharing enabled on one or both machines, and set up a directory to be shared: right click on a directory, select Sharing..., the rest should be obvious. Now when you double click on a computer in Network Neighborhood, you'll see any directorys that are being shared on that machine. Congratulations! You've got a network. At least between the Win95 machines...

Now getting TCP/IP setup up to allow all machines access to the Internet is a whole other can of worms. You'll have to pick a machine to be an internet gateway, and install WinGate on it. (www.wingate.net) It should be one that already has dialup networking installed and working. All other machines will communicate with the internet through this machine. Be sure to read the helpfile, there's a lot of configuring you have to go though...

Have fun! (hehehehe, he won't last a second through the WinGate config...;)

Hi,
        I've got an Atari 1040 STF with an SC1224 atari RGB monitor and an
external 20 MB Supra hard drive.
$120 buys it all.
Everything works, and is in very good condition.
And yes, I have the mouse.
Also, the monitor has built-in speakers.

You also get 3 years worth of disks from START magazine, a few games, and
Mark Williams C compiler with manual.

Please mail me if interested.

That sounds like a serial mouse. And it's not simply a matter of rewiring,
or a patch.

You can plug a serial mouse into the serial port of the Atari machine, and
use it with the aid of a serial mouse driver called Mouse 2.5.

I'm currently designing an adaptor that would allow you to connect any
serial mouse to the Atari mouse port, so that your serial port is still

free for a modem or some other device. I may be able to offer designs for
the adaptor or sell finished adaptors, but I don't know about that yet, it
will be some time away at least.

 HS> either way, so I may as well set it to Magic...

Whoa there! Big mistake!

I hadn't got around to doing this, but I was messing with Sysinfo and saw an NVRAM-setting page and did the deed.

I then needed to reboot into another XBoot set and I didn't get anything on screen at all. I suspected a problem with the graphics card, so tried another reboot with the monitor plugged into the TTs VGA port and there was an STLow screen sitting there. The hard drive was nowhere to be found and I needed to locate a disk version of HDDRiver to get access to it. Switching the boot parameters back to 'None' got me sorted out...

<phew>...

So, what should I select? 'None' sounds like I'm missing out on something, but my experience tells me different...

Does Cubase and Notator come on 360 K or 720 K disks? Where can I get them in the Toronto , Ontario area? What are other good shareware freeware programs to get started with MIDI?

My problem is I have an Atari 520 which I upgraded to 1 Mb, unfortunately the floppy is still a 360K. Are the floppy drives in the Atari's standard floppys, can I just buy a 720 and install it?

thank you in advance........

HI Angie

Sorry, can't help you at the present as I've got my own CD-ROM
problems. A little more info may not go amiss; e.g. make and model of
hard drive and CDR.

If the hard drive seems scrambled, is it still scramble when you
REMOVE the CDR?

Cheers! for now
               Steve

Now I remember MidiCom. I've seen the demo, but apparently the program has
not been translated into English (that I've heard of, at least).

Correct me if I'm wrong, but couldn't MidiCom connect multiple computers (>2)?

For those of you who have not seen the best disczine around Click on the links below and get disc 1 and 2 or issue 2 of MEGA DISCZINE.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't.

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

So come on, Lets have some feedback, I want to make it YOUR zine, Let us know what your would like to see happen and the MEGA team will support your idea.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for issue 2.

Hello!

I picked up 2 PAK030 boards from Toad Computers not too long ago. Unfortunately they lacked any drivers or docs. I wish to put one of them into a Mega STe, but need some guidance. Any FAQ or text document I could look at for help? Anyway, here are my observations from the card that looks most promising to work:

All sockets on the board have ships except the M68k socket, the MathCo socket, and CON1 (where the FRAK goes????). The CPU is a Motorola SC414075RC50 (50 Mhz 68030 w/MMU?). The crystal on the board looks like it is 32 Mhz (9408T XO-105BIC .32.000000MHz). The chips with labels are P4_50, P2_50RST, P3_PUK (A gal to allow a switch between the 68030 & 68000?), and what I believe are the TOS Chips, 306E_U10, 306E_U11, 306E_U12, and 306E_U13.

THe following jumpers are empty: J11, J4, J3, J6, J1 and J2.

J7 ++O J5 ++ J9 ++O J10 ++O J8 O++

The board is connected to a PU_STE V.2 made April 1995.

Also, what do I need to do to add a math coprocessor?

Thanks for any help!

Keith

I have gotten back into Atari for midi. A few of the programs I use (especially DR T) use protected disks. Some of these are 10+ yrs. old. Can anyone suggest a utility to make copies of these disks (which will duplicate even the protection)? I have no desire to pirate any of this stuff. What I want is a copy to use for protection from doing a bunch of stuff and then either a) not having access or b) having to beg desparately here in the ng for help.

Any help is appreciated.

Ed
Balt. MD

ps: I did a quick scan of the faq and found nothing covering this. If it is in there, a little direction would be appreciated.

Yes you can,- I used it for some time. You can connect from 2 to 7 Atari computers together. It works, but it is slow.

cheers Joergen

Hello Harry!

Switch the boot preference entry either to "TOS" or to "None", there is no difference. Switched to any other, you are not able to boot from a GEMDOS partition.

Greetings,
Carsten

Hmm, strange. I suppose it makes some sense as Magic is loaded via TOS. Presumably the 'Magic' setting would make sense if it were to be loaded directly from a bootloader. However, I don't know of anything that does this. Presumably someone had this idea, or there would be no need for a 'Magic' setting as 'TOS' would suffice.

J

PS. Thanks for the info on 3-button mices. Now, which one to get ... :)

Hmm, some while ago i tried to do something like that, but from different angle.

Atari's mouse is very simple device from electronics standpoint, because it delivers signals from photodiodes to computer unchanged. So it made sense to pull that stupid IC from PC's mouse, fit simple 74HC04 (inverter actually playing buffers role here) and use 9-wire cable!
I actually did that on one mouse and it worked O.K., but when trying to do some more, I couldn't find flexible cord with 9 wires (well, actually 8 for 2-button mouse: 2 for power, two for buttons and four for X&Y direction signals), so after I found Golden Image's site with decent mouses, I have stop searching for cord....
There is one more thing about that. PC's mouse is as everything else related to PC very awkvard electronically. Instead choosing natural solution a'la Atari or Amiga they use small microcontroller to count steps and changes in coordinates and state of the buttons via RS232 via 1200 or 2400 bps. UART in the PC then receives that, deserializes it in order for CPU to read it and redraw pointer accordingly. Because all this happens at low baudrates and is not in sync with screen refresh it certainly means some timelag and possibly non-smooth behaviour of the pointer.
That's why they use some "clever" things as "interpolation", "dynamic resolution" which means using software to clean (to some extent) hardware mess.

I have Sinclair QL (besides an ST or two), for which I have made number of interfaces, and also mouse interface. It is consisted from two 8-bit up/down counters, one for each direction, which counts steps of each wheel in the mouse directly as it happens. CPU has to read counters (two instructions) and button states (one instr. in MC68000 assembler) to get delta x and y from last cursor redraw.
Furthermore, that way is perfectly in sync with picture refresh, so if you are doing it via vertical blank interrupt, you get nice ultra nice movement and very low CPU overhead.
Not to mention that now bottleneck is in the mouse mechanics and not in electronics. I mean those counters can count at 100+ MHz effortlessly, so you can be Jor El' son (Supermen) but you can't be faster than them.

Regards,

Branko

Greetings,

I am wondering whether anyone has considered adapting one of the MAC SCSI->Ethernet adapters for use with the Falcon. One that I saw reviewed was the DaynaPort Pocket SCSI/Link, and it would seem that all that would be necessary may be a micro DB50->DB25 adapter, and of course, someone would have to pen some drivers ;)

That cannot work. TTL transmits a "1" as +5V, while RS232 marks a "1" by anything between -3V and -15V. "0" is transmitted by 0V in TTL but anything between +3V and +15V in RS232. So the voltage coding is entirely different and incompatible.

Cheers Peter

Wolfgang Heidtmann <Wolfgang.Heidtmann@prompt.de> writes:

> This is digital: If it's not high, it must be low, what else?

Seems simple but it doesn't work that way usually. For instance CMOS inputs, powered by +5V must be driven by +5V +/- 0.5V for a "1" or 0V +/- 0.5V for a "0". Trying to apply, say, 2.5V to such a CMOS input will cause it to draw excessive current, enough to destroy the chip !

This is why CMOS only consumes power when switching, and why the power consumption increases with clock rate (switching frequency).

So even if it works in some configuration, I would call it dangerous and unreliable.

Cheers Peter

Can you get nice troughput in the WinGate? I've got Mac experiences from the AppleTalk to Ethernet and TCP/IP that still gives me nightmares.

BTW, remember not to use totally different connector and cable-types in your Ethernet!!! You'll be in hardware hell I can tell!!! AUI, BNC, RJ45 and so forth ... if you have different networkcards it'll get tricky and expensive.

Recently, I was donated an Atari520ST Fm computer complete with monitor. Unfortunately, the guy who gave it to me left me with zero software. I know absolutely nothing (obviously apparent) about Atari computers. The only close experience was an Amiga way back when.

My question is how do I get this computer up and running? I suppose I need a

sort of boot disk. Does this have to be formatted specifically for Atari
computers? I was thinking I could download (with my Wintel) something off of
the web to make it go. Any advice, suggestions, or good web sites would be
appreciated.

Thanks,

Dennis

First thing to do is to check out the Atari ST Quick FAQ, it has most of
the information you'll be looking for:
http://www.geocities.com/MotorCity/2090/quickfaq.htm

> My question is how do I get this computer up and running? I suppose I need a
> sort of boot disk. Does this have to be formatted specifically for Atari

Wrong, the entire OS, called TOS, is in ROM, you just have to switch on
the machine with any blank disk in the drive. That was a serious

advantage compared to the Amiga in those days. An amiga really needed a second floppy drive for any serious use. If there is no blank disk, just wait a few minutes for the desktop to come up, then format a DD disk with the desktop option.

> computers? I was thinking I could download (with my Wintel) something off of
> the web to make it go. Any advice, suggestions, or good web sites would be

All is in the Quick FAQ, including FTP sites, desktop operations, file transfer and basic software.

Cheers,
Nick

Not so sure. (you're right, but there're some tricks). The voltage used by a mouse is closer to 3V than 15. You can so use a pull resistor to adjust levels.

Can anybody tell me if I can use a Genius Hand Scanner (for Atari ST) on an IBM PC? Possibly with modification? Although rather not modify (unless switchable), so as to remain useable on the ST.

Please email: ps1908@scitsc.wlv.ac.uk   with any info...

Thanks in anticipation... Steve Ridd

Just recently, I heard of a lady in Canada
who was so adamantly in love with the First
Word word processor that she absolutely
refused to use any other processor on any
other machine, much to the chagrin of the
local intel-based computer club that was
trying to get her a new printer. After a few
quick emails, we'd sorted out the printer/driver
crisis (an Epson Stylus Color 400 was recommended)
and everything appears to be up and running at
this point.

However: the best answer is to look at the currently
available software that runs on it ... which
is a lot! (Compatibility means more in a
GEM/TOS system, it seems....)

Check out the web pages of the various Atari
dealers on the web and/or call and ask for a
copy of their catalog.

It just happens I keep an on-line list of dealers:
http://www.tmisnet.com/~strads/hq/sources.html#Dealers

Feel free to ask questions about what you find,
we're pretty friendly around here.

Need to convert Atari ST files to DOS for cubase.

Anyone know what the program is and where I can find it?

HELP!!!!!!!!!

> HELP!!!!!!!!!

No problem.

* Format a DD disk on the PC,
* Run Cubase on the ST and save your tune as a .MID file
* Import the file in Cubase on the PC
* Drink some beer to celebrate the success :)

/Peter

I�ve had the same problem, but it is possible to make a backup of DR T�s programs.

You�ll need to use a copyprogram like FastCopy or similar and force it to copy 10 sectors instead of 9.

Thats about it!

I've done some research on this, and while it's easy to get hold of
quite cheap cards, it's *impossible* to get proper docs :-(

I've just got myself a TT, and I want to use TT-high on my 17" SVGA monitor. I know that Hard & Soft produced an adapter like this some time ago, does anybody know where I can find one? Or have any docs so I can build one myself?

Also, if anybody has a spare 4Mb or 16Mb Fast-RAM card I'm very interested...

Newsgroups: comp.sys.atari.st.tech

For those of you who have not seen the best disczine around Click on the links at the end of this message and get disc 1 and 2 of issue 2 of MEGA DISCZINE.

If you have seen MEGA why have you not supported this new zine. There are lots of you out there who must of liked something in it. But you don't tell us what you liked and what you didn't. There are a lot of people who have not yet seen MEGA so get downloading there or over 200 articles on the 2 discs with a nice shall which anyone can use without any info at all on it.

There are many sections in this zine, Some or 1 off and are very interesting to read, It would be impossible to list them all so heres a quick rundown.

True horror/ghost tales, STOS, Tesla, Electronics, jokes and humour, Dreams what they mean and stuff, get rich, UFO articles, stories, Anti car crime, Reviews, Returned questionnaires, Science, Black holes, and much more. Simply take a look and you will be amazed on what we have found for you. There should be something for everyone in issue 2. Lets here what YOU would like to see appear !!

It only takes a moment to return the questionnaire, or to offer some ideas of your own. We need your support NOW. The more support we get the faster MEGA will be produced. Anything you do will be included in issue 3 which is currently been done by the MEGA team.

I want to make MEGA "YOUR" zine, so tell me what you want and we will include that page in the next issue. Any ideas not matter who obscure or small they be, are more than welcome.

The MEGA member list is getting slowly longer but we need more feedback, We need to know that people are reading it and liking it, There would be little point in producing a zine if there is now one reading it. This would be a great shame as there is now other zine like it.

Why not send in something in, Ramble on about anything you like, We want to hear from you. Get your name added to the credits list at the same time.

I have mailed MEGA 1 and 2 to god knows how many people over the last month, Well, Ok, It has not appeared on my site yet, But you can get it now if you wish. Simply join the mailing list and you will get MEGA before it goes onto my site. Out of all those people how now have got it, only a handful have had any comments. This is good but we need more now !

Everyone who has sent me mail over the last few weeks has not been added to the list. If you would like to be added to the mailing list then please re-mail me so I can add you to the list. Please check if you have requested to be added to make sure you have been added.

Issue 3 WILL appear but how soon all depends on you. So get writing and send something in, or at least tell us what you though about MEGA. It only takes a moment so why not go for it, your not going to loose anything by sending a mail to me.

If you have seen UFOST by Lee Round then please support his UFO zine with you UFO related material. Lee is now in 2 minds weather or not to do issue 3 because of all of you how seam to be scared or writing a letter to him. If you would like to send Lee mail, Send it to me but put "FOR LEE ROUND" in the subject box and I will be happy to pass it onto him. If your interested in UFO's or related stuff then request issue 2 of UFOST now, I regret it still has not been added to my site. Send me a mail if you would like a copy.

I have issue 2 ready for E-mail should you dare to ask for it. Sorry but it has not yet been added to my site, Keep trying though !!

Here are the URL's for MEGA Disczine issue 2.

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d1.zip

ftp://ftp.funet.fi/pub/atari/mag/mega/mega2_d2.zip

Thanks to Deano for the upload of issue 2.

Without having your system on my test bench, where I could run a thorough
diagnostic and tell you definitively exactly what the problem is, here are
the most likely causes of your problem:

- bad disk drive
- bad drive controller chip (WD1772)
- bad Motorola sound chip (the sound chip controls timing)
- bad GLUE and/or DMA chips

Greetings,

A friend of mine just bought a Falcon which refuses to store its NVRAM settings (for default resolution, columns, monitor type, whether to run memory test, etc...) Does anyone know if this is a hardware problem that can be rectified, or some strange software issue?

Any assistance would be greatly appreciated.

Hi John...! Is he using the NVRAM CPX? Its dead-handy for setting all
those parameters. Hmm...it won't let you set the memory test on/off,
though. Don't know what will do that.

If that Falcon older as 5 years?
Good chance for an empty lithium batterie in the NVRAM (DALLAS) Chip..

Try:

Reset the hole NVRAM by NVRESET.PRG

Made new settings with BOOTKONF.PRG (V 1.3) (Uwe Seimet)

Reboot after setting.

Watch that setting over night, next day..
If you found not the same setting -> replace dallas NVRAM
(Big chip under his keyboard...)

How to do that? -> DOITF030

Regards, Robert

I think that the german 'HD-Optimizer' (V 2.7) (I don't know)
can do that job, but i'm not sure, realy..

Send your question to maus.sys.atari.software
I'm sure you got the right answers in this group.

(I don't use the long file names)

I like to found a nice utilitie first...

Regrads, Robert

Which machines are they socketed on? On both my, and the wifes, STEs they're not. They aren't in my brothers FM, nor were they in my old STFM.

:   Hi John...! Is he using the NVRAM CPX? Its dead-handy for setting all
:   those parameters. Hmm...it won't let you set the memory test on/off,
:   though. Don't know what will do that.

Yes, we tried the Bootconf cpx and a program called Falcconf or something
similar. Neither produced settings that stayed when the computer was
rebooted. The memory test disabler is a program called Nomemtst - or
something similar (can you tell I don't have my Falcon in front of me?)

;)

I am helping a friend upgrade his Atari STFM Ram. Unfortunately he does not have any literature on the hardware and I am not that learned about Ataris.

He already has a memory expansion card with 2Mb of ram (a total of 2.5Mb), but the system will not upgrade further with simple insertion of more SIMMs. Does anyone know what the problem is? I personally think that one needs to somehow disable the 0.5Mb onboard memory. If this is the problem, is there a jumper for disabling this ram.

Any suggestions ? Thanks.

In GDOS graphics mode I'm not sure that an updated driver will give you anything that a 4L driver won't. Can you get 600dpi?

Seeing as you're restricted in memory and JPGs can be very large, 1st Guide is the most certain choice for viewing due to its method of dithering down to match your screen res without needing to load the expanded JPG into RAM first.

For GIFs, the suggestions of Speed of Light v3.8 or Photochrome v4 are probably the easiest to use.

Hi Ian, on 20 Apr 98 you wrote: ...respect, brethren
 ib> As the TT 030 has a 32mhz chip is it possible to the the 030 in the
 ib> falcon to run at 32MHz by overclocking it or something?

Yes, of course - that's what the original accelerators like Power-Up were doing. But overclocking doesn't overcome the bottlenecks inherent in the Falcon's design. This is what's addressed by Nemesis and what makes it far and away the best (only?) accelerator for the Falcon. It speeds both the CPU and the DSP and opens up the bottlenecks (especially beneficial for higher video resolutions).

However, installation is not trivial, so unless you really like to get your hands dirty and are prepared to face potentially difficult problems (and depending on your location) I'd definitely go for the fitting service, either at Titan or the authorised fitting companies:

==========
NEMESIS UPGRADE SERVICE

FDC Electronics (Anglesey) - Tel: 01407 730132 - Email: fdc@cix.co.uk
MJL Insights (Aylesbury, Bucks) - Tel: 01296 622400

New Nemesis prices - �69.95 (Registered APEX users �59.95)
Power Pack   - �99.95

Carriage is extra unless otherwise stated, so please call first for further advice. Please make all cheques payable to TITAN DESIGNS LTD.

```
Titan Designs/Black Scorpion Software
6 Witherford Way, Selly Oak, Birmingham B29 4AX. U.K.
Tel: +44 (0)121-693 6669
Fax: +44 (0)121-414 1630
e-mail: TITANWEB@compuserve.com

Browse our Web site for details on any product;

http://ourworld.compuserve.com/homepages/TITANWEB/
==========
```

IMO (which not many people agree with, but I don't care) a Falcon's not worth having unless it's got a Nemesis and the stability fixes that get done as part of the fitting process. It makes a Falcon into the machine it should've been in the first place.

You are perfectly right, normal Ataris have only 2 banks of ram. So you
can have 0.5, 1, 2, 2.5, 4 Mb, but not more than 4 and especially not
4.5 Mb.
There is no other possibility to disable the 0.5 Mb than by hardware
changes to the mainboard (cutting, soldering).
You are welcome
Wolfgang

Hi! Sadly, i am having to sell my atari hardware & software.

here is what is available:-

Atari 520 STFM with 1MB memory & Autoswitch Overscan card.

Also External floppy drive.

Star LC20 Dotmatrix printer, excellent condition

Trust VGA mono monitor converted for use with atari hi res mode.

Alpha Data mono hand held scanner, with original Touch Up Software

Protext Version 6.5 (Full software with original box and manuals,
excellent
for word processing)

Loads of games, including Frontier: Elite II

Also 80+ Atari magazines & coverdisks.

Cost:- 200UKP or nearest offer

Contact:- Brian Innes, e-mail ceebti@cee.hw.ac.uk

Tel:- 0131 443 4226 (Edinburgh)

Hello John,

> A friend of mine just bought a Falcon which refuses to store its
>NVRAM settings (for default resolution, columns, monitor type, whether to
>run memory test, etc...) Does anyone know if this is a hardware problem
>that can be rectified, or some strange software issue?

This is definitely a hardware problem.
You'll have to exchange the RTC-chip, which contains the backup-battery. The IC-number on the motherboard is U64, located roughly in the middle of the PCB and close to the front edge of it. The chip is a "Dallas DS1287", a chip that should be available in any store that sell electronic components.

Good luck and best regards,
Claes

Okay, I apologise for suggesting the obvious <smile>. Several others have
suggested that if that Falcon is an older one, that the battery might be
dead...Just an alternative to check out... Good luck! ;-)

Yes. You're right! The onboard 0.5 has to be disabled. The method
rather depends on what sort of RAM expansion you are using. Often the
jumper will be on the RAM card. There is no jumper on the mother
board. If you can trace the 'chip enable' track all you need to do is
pull it high via a suitable resistor.

First of all, thanks to everyone for their suggestions, and help. Here are the results.

I have tried 1st Guide, and it will not work.

I have tried Speed of Light 3.8, and I do not have enough memory.
I have tried Photochrome, and I do not have enough memory.
So...ti looks like I need a memory upgrade. Since I have found that I have TOS 1.02, I probably need a TOS upgrade as well.

m> I have tried 1st Guide, and it will not work.

Can you be more specific? 1st Guide won't do GIFs, but it should work fine with JPEGs, even with limited memory.

m> I have tried Speed of Light 3.8, and I do not have enough memory.
m> I have tried Photochrome, and I do not have enough memory.
m> So...ti looks like I need a memory upgrade. Since I have found that
m> I have TOS 1.02, I probably need a TOS upgrade as well.

You might just want to look for a deal on a used Falcon or something.

* LED v1.51 * Just got pulled over by the L.A.P.D., and man, am I beat.

Not that I'm aware of. The easiest way is to move the files over to another
VFAT capable partition and back again... if you have the disk space...

>Why not just try a Nemesis? Aren't they pretty much the same?

Sure, faster and much more expensiv. It's a great accellerator, no discussion.
But he's asking for an PowerUp2.

(That remeber my to the three month if i have to wait for my first nemesis
module..) ;(

Sure, it works nice..
Regards, Robert

Hello everybody,

Some informations about SOFTJEE's product for Atari Falcon.

** EXPAND

Expand is a Midi Sampler Software. You can load audio sound, make
instruments multi-sample and play them with a Midi keyboard or a
sequencer. You can set too the ADSR for each sound, have graphic
panoramic setting,...Expand understand the most of Midi messages like
note-on, note-off, program change, main volume, pitch, fine,...

You can too put some digital effects on each channel like Reverb, Echo,
Chorus,...

Last revision is 1.03 with the following function added :
Play AIF in D2D, load WAV, Selecting of External Clock, Frequencies of
replay, set repeatt start/end of each sample, set polyphonic voice for
each Midi channel (select automatic for dynamic polyphonic voice or set

the number of voice for each channel).

** MIDPLAY

Midplay is a Midifile player which play MID with audio sounds (so you can hear Midifile only with Midplay and your Falcon). Midplay can play too KAR file and displays the text of these files. Midplay use a GM kit audio to play midifiles. You can mute each channel, have informations on it,...

Last revision is 1.07

** Pretty

Pretty is a Midifile Player BUT with MIDI OUT.(this is the difference with Midplay). You can plays play list of Midile/Dir of Midiles. Pretty have too severals options like "Record Module" which allow you to record in audio the Midifile you're playing and "Grid edit Module" to display/change the Midifile.

Last revision is 1.01

** DIGITAL HOME STUDIO (D.H.S.)

D.H.S. is a very big soft allowing you to sample audio sound, sequence audio sound in D2D or memory/ sequence Midi informations. D.H.S can load 256 samples and you can play them with any note you want. You can put them on the sequencer or edit them in the sampler. You can apply digital effects in real times or in the sampler. You can use in the sequencer Midi information/audio sound/Direct To disk sound in the same time. You have too some graphic function to set main volume of each track, effect level,...

D.H.S. manage 64 voices/ 32 tracks and play at 50 Khz 16 bits.

Last revision is 1.07.

You can see more details on the Web :

http://perso.wanadoo.fr/softjee/

or mail to :

Yes.

>If this is
>the problem, is there a jumper for disabling this ram.

There is. You might have to tell the MMU about the extra ram as well
but I can't remember after all these years.

If the expansion board was made by Marpet then there's a chance I
could dig out the installation manual. Knowing the motherboard
revision number would help narrow down which of the multitude of
photos etc to look for.

That's not true.  Hard Disk Optimizer (HDOPT26 or something like that)
handles VFAT partitions.

I have quite a load of Atari computer stuff I'd like to sell. I'm in Los Angeles California... willing to ship if you cover the cost ;)

Falcon has 4megs, Internal HD, mouse, system disks
MegaSTE has internal HD, keyboard, mouse, system disks
1040ST has external HD, external floppy (as well as the stock internal) and mouse
I have two monitors, the 1224 and the 1435
Everything is in excellent condition!!!

LMK if you're interested! Maybe send me an initial offer and we'll go from there...
Thanks!
Roagie

I've been having problems posting this ... if you've
seen it twice already, please accept my apologies!
!@#$%^&* Free Agent, someday I'll get my Falcon on-line!

For quite awhile now, Wizztronics (http://www.wizztronics.com) has been asking for comments and requests about what we would like to see in their forthcoming TOS/GEM clone computer.

I've sent in a bunch of email suggestions, and recently asked when the promised survey would be posted to their web page. Part of the reply from Steve Cohen read:

>> After reading Email, almost daily I find many users
>> come up with brilliant suggestions. I'm sorry we do

>> not reply to each message sent, it would simply
>> take too much time away from developement.

I asked him if it would be okay to publish this comment
to the Usenet, and he said:

>Yes I have no objections to your request. We want
>users and prospective users to know what's going
>on. We do not want people to think we forgot
>about, or that we do not read their mail. All
>responses received from customers, and users of
>the TOS platform are important to us.

Now is the time to get that suggestion in writing and
emailed off to toscompinfo@wizztronics.com !! You
don't have to be a computer scientist to make a
suggestion, either -- if you've ever said to yourself
"I wish my computer would..." or "I wish I could do
this with my machine...", write it down and send it in!

On other computer platforms, you only get what they
have to offer. On our platform, you get a chance to
directly influence the features and capability of the
next update to the operating system & hardware.

Now's your chance!

-- George Crissman

I remember hearing many years ago that 'hot plugging' a printer to an Atari computer could cause serious damage. In particular, one person's sad tale remains etched in my memory: he reported that by plugging his printer in while the computer was on had caused fatal damage to at least one chip in the computer. Needless to say, I've been careful not to do that myself.

My situation now is this: I've got a printer (HP DeskJet 600) connected via a switchbox (A/B) to both my MSTE and a Pentium. And the question of course is: is it safe to toggle from one computer to the other using the switchbox without powering off the Atari. People seem to do this all the time with PC's, but I'm worried about the ST.

Any comments?

Thanks,
John

The printer ports on PC's are buffered, something that was totally unknown for Atari's developers...
No Atari computers have buffered printer ports (only the joystick and midi ports are safe to exchange "hot"), which means you always have a risk of

damaging your computer when you connect or disconnect something when it's running. However, this risk is much smaller when you use a switchbox, since you switch all the connections at the same time and you have much less risk for static electricity, so in your case it would be rather safe - but you can't be absolutely sure...
If you do have a strike of bad luck, the most common problem is the soundchip (YM2149), which contains almost all the printer signals - just exchange it and it'll probably work again. If that doesn't help, exchange the 68901 chip, which contains the last signal for the printer and should do the trick.

Best regards,
Claes

j> Why not just try a Nemesis? Aren't they pretty much the same?

The price may be comparable but the effect certainly isn't.

The Power Up 2 goes some way to doubling the CPU speed, but leaves the system bottlenecks in place, such that GEMbench will report something like only 137% CPU compared to an unaltered Falcon.

Doug Little explained lots about the Nemesis during development:

==========
A normal spec for the Nemesis will make the following differences:

System clock: 48MHz

CPU clock: 24MHz
Bus clock: 24MHz
VID bus clock: 24MHz
DSP clock: 48MHz
FPU clock: 48MHz
Videl clock: 25MHz, 32MHz or 48MHz (selectable)

The idea behind Nemesis is to allow the user to change to a higher system clock, without causing the machine to get upset and stop working. This has several advantages:

1) Speed (of course).
2) Faster video bus - quicker graphics, bigger display.

3) Faster dotclock - bigger display & higher monitor refresh rates.
4) Accelerated access to Expose digitiser (if you have one).

Nemesis speed advantages are easier to estimate - the system clock affects everything except the DSP (which Nemesis accelerates separately), so a jump from 16MHz to 20MHz using Nemesis produces a 25% boost across the board - including the display. A jump from 16MHz to 24MHz produces a significant 50% boost across the board.

Nemesis also allows large VGA truecolour modes due to the higher bus bandwidth. 640x480 TC on VGA is definitely achievable - perhaps more.

From: mb@tos.pl.net (Mario Becroft)
Subject: Atari mouse port 3rd button query
Date: 1998/04/27
Message-ID: <OZAXC6K@tos.pl.net>#1/1
X-Deja-AN: 348030839
Organization: Tariland Computer Club
Newsgroups: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

I noticed after looking at the Atari mouse port pinout in my TT030 user's manual that on pin 5 there is room for a third (middle) mouse button.

While I don't know of any software that makes use of the third button, I wonder if the facility is there for a third button on pin 5, or is pin 5 simply not connected or ignored by the keyboard? If pin 5 is not ignored by the keyboard, does TOS support the third button? Is there any GEM software that uses the middle mouse button?

I ask as I am working on an adaptor to allow a serial mouse to be connected to the Atari ST mouse port. I would like to make the third button do something useful, but if pin 5 is disconnected or ignored it would not be sensible for me to use it. The other option is to make the third button act as a double click or as a simultanious left and right click, but I would not want to exclude users of perhaps X Windows or something that does make use of the third button on pin 5.

Another question - I observe that when the mouse is moved too quickly on my TT the mouse cursor moves in the reverse direction for a moment. I have noticed the same behaviour on other Atari ST series machines. (The effect is more noticable with third-party mice as they are faster than the Atari mouse.) I guessed that this must be caused by a movement count in the keyboard processor overflowing when the mouse is moved too quickly, and causing the sign to change. Is this really the reason? Is there anything I can do about that?

And finally, would there be any interest in such an adaptor? There is a serial mouse driver available allowing a serial mouse to be used on a serial port, but then you have the mouse port doing nothing while on the ST, with only one serial port, you have no serial ports left. Wouldn't it be better to be able to connect a serial mouse to the mouse port, leaving your serial port free for a modem? What do you think?

I look forward to your comments.

```

Hello everybody,

Since about 2 years now I've a TT030 running MiNT and Linux, but
I want to use Ethernet to communicate with a Apple Mac IIci and
a HP9000/340 in a Unix env.

So I bought a Riebl ethernet VME contrl. but when I insert it into
the TT and powerup the TT stays dead (now disk activity and nothing
on the screen). I also have tried an other ethernet card(Bionet100)
but no change. So then I thoughed the VME contrl. on the sys. board
of the TT maybe faulty so I tried an other sys. board but the problem
remeans. So after a lot of money and time I've got I extra TT sys.
board and a Riebl ethernet card.

Please can anybody help me, the shop where I bought the stuff doesn't
know anything.

Thanx for any help or tips, Robin....

Hi folks

Is there any way that I can connect a falcon to a TCP/IP network either via serial link or lan ports,
The PCS are running Windows 95 and Windows NT4. If possible i dont want to have to install linux but
if that's the only way...

If possible i'd like the falcon to treat the shared network drives as normal drives on the falcon,

The PCs have 3COM Ethernet 3 network cards if that is any help?

looking foreward to any reply :-)

Ok, I sugesst removing the cd rom's terminator, and putting the cdrom
in between the st and the hdd. It worked for me.
(If harddrive is termanated, nothing after the drive will work
correctly.) Hope this helps,

Newsgroups: comp.sys.atari.st.tech

Hi Folks,
Has anyone used an IBM Ultrastor ES drive of any size on a Falcon? I'm about to get a 2.1Gb one and wondered if there was anything to look out for. I have an IBM DPES 1.08 Gb drive and you have to disable the <Unit Attention> function by setting Jumper 5, is there anything similar I must observe? Also ATM I am using AHDI6.n, where <n> is a small numer that I can't remember, probably 05, will it handle this drive OK? Will it let me run three 700Mb partitions? I bought the drive to complement the CDR I've ordered (see other post), so I want a 700Mb partition size to act as a CDROM image for use with CDRecorder Pro 2, I know it doesn't really need one, but it makes me feel more secure....The other two partitions will be used with either Quincy or Digital Home Studio (when I make up my mind) as D2D locations (record into one partition, back up all the data onto a single CD), anybody know of any problems likely with this?....I can always re-format the DPES for use as D2D, as I know it's good enough...

Many thanks for any help and advice offered. Group or email, I'm not fussed, in fact Group might be a good idea as this kind of info will be of use to plenty of people, the 2.1Gb drives are getting a lot cheaper (I paid 60 UKP, about 180 DM for it), and even for 8-track D2D they are big.....

Hi Folks,
I got an offer I couldn't refuse on a CD Recorder (Yamaha 2x4x I think) and I've ordered Soundpool's CDRecorder Pro v2 softs to drive it and I was wondering if anyone could offer me some advice.
ATM I have a Matsushita (Panasonic) 6x CDROM drive hosted via Extendos as drive P from SCSI ID #1. I understand that for CDR Pro I need to use Metados, but

having trawled through the various CDROM's I have the most recent version of Metados I could find was v2.7 and the .TXT file states that it doesn't work with a Falcon, even though it then talks about IDE locations....Can I continue to run Extendos for the CD and only have to set up Metados for the CDR, or should I try to get Metados to drive both (can it drive both?).

Any advice offered gratefully received, post either to me or the Group, with the prices of CD Writers as low as they are (the TEAC 55S 4x12x is less than 300 UKP now) I think we will see more Atarians using them, and having the required knowledge discussed publically will be of benefit to all..

Hi All,
A friend of mine sent me a picture of himself (JPEG). Now, how do I view this picture with a 1 meg St1040f? Also, is there a way that I can view GIF images?
I appreciate any suggestions.

Mike.

I have an old ST and it has no built in modulator, I tried building a
modulator and connecting it to the composite video output of the ST, but
there seems to be no signal coming from this pin as all I get is a blank
screen on my tv, the modulator seems to be working fine as I can tune my tv
in to it when I switch the test signal on.  I was wondering if there was a
way of connecting the RGB and  V and H syncs from the ST to the scart socket
on my tv instead of using the modulator.

Thanks for any assistance,
```

Probably Speed of Light GIF is the best GIF viewer for the 1040ST. You can
get it at e.g. ftp://atari.archive.umich.edu/atari/Graphics/spoflt38.zip

Don't know what to recommend for JPG, lot's to choose from but as I own a
Falcon now I haven't tested the ST stuff. Look at the other stuff if the
UMich graphics folder (see the address in the above paragraph), or try:
http://ping4.ping.be/dipching-drulkhor/PRG-GRAP.HTM

Speed of Light is also probably the best JPG viewer for the ST, too.

Actually, the best way to view GIFs or JPGs on an ST/e is probably to convert them first to TGA and then use the Apex TGA viewer. It's a bit of a hassle, and TGAs are rather large, but the results are worth it, if it's something where quality is important to you.

PhotoChrome is also very good for GIFs and TGAs.

>The PCs have 3COM Ethernet 3 network cards if that is any help?

>looking foreward to any reply :-)

You could connect the the Atari and PC together via their serial ports and use NFS (Network File System) on both machines to allow drive sharing.

I don't know of any NFS drivers available at the moment for GEM, but NFS is available for MiNT. To set this up you will need MiNT, MiNTNET and NFS for both the PC and Atari.

I do have details on how to do this on my Home Page supplied by a guy called Gerry O'Rourke, but my site is currently unavailable. So, I could E-Mail/Post these details to you if you like.

Hope this helps.

Absolutely, that's how you _should_ do it. RGB gives a better picture
than composite.

You'll find pinouts to the SCART and Atari connectors in the Quick FAQ.
see below:

Cheers,
Nick

Hi. 8-}

I dont recall saying anything to anyone about gemini?

I have Thing and it seems OK if you've got loads of RAM, Still it's good at what it does,
and it lets you use KOBOLD in it! (easier than in magxdesk)

To attach a PC keyboard you need an adaptakey interface, the one that's used for tower case setups. In the UK, you can get it from Titan or Systems Solutions probably.

For the mouse, get a PC serial mouse and attach it to the serial port with a standard DB9 to DB25 adapter and the mouse25.prg driver in the auto folder. That driver can be found on umich or lip6.

Cheers,
Nick

In some Mac's it's possible to overclock the 030 (20->25Mhz and 25->30Mhz seems to be common for 030's, such as the IIsi/ci/fx Mac's). The 68881/2 seems to be a very overclockable chip, as long as they get cooled (the same goes for the 030). So the CPU/FPU seems to be possible to tune a bit, the problems are most likey among the support chips, eg the Shifter and the Glue parts. I dunno how those chips reacts to a higher clock frequency.

The 030 used in the TT is a 33Mhz part but the one in a Falcon is a 16Mhz part, but these should be possible to find rather cheep in various old Mac's and Sun 3/80 workstations. These are likely to carry a FPU as well. So obtaining a faster chip shouln't be that hard, they are still listed in Motorolas price lists and can be bought from various sources.

Regards.

Yep, some older ST's doesn't have the composit video signal on pin 2
What you found down there is composit syncron..

Only newer machines have composit video (FBAS) on pin 2

(Same as with pin 8 (+12 VDC)) That's GND on some older machines..
Check that..

>way of connecting the RGB and V and H syncs from the ST to the scart socket

Well, that's allways the better way to get a good display.

so that would meen losing the ST's modem port?, Is there any way of separating the
mouse and
joystick system from the keyboard so that it can still be used, (bit off of an old
keyboard prehaps?)

Ian Norton :)

(if it means i can still use a modem some how then i might go ahead, as i have 2
partially dead
sts and a big towe case.)

There is an Atari dealer in Oakland that can help you with your Atari.
ATY Computers (www.virtual-markets.net/vme/aty/) sells Atari stuff.

Atari STs formats a 720k disk semi-compatible with IBMs. You cannot
format 1.2Mb HD disks. IBM programs will not run on Ataris, but since
this is an obsolete system, you can get programs really cheap now, like
LDW Power spreadsheet for $29.95 from the original $109.99.

Atari mouses are incompatible also. Atari monitors are also
incompatible. But I found a color monitor at Weird Stuff in Sunnyvale
for $39.

You can use a SCSI hard drive with a SCSI adaptor plugged into the DMA
port in the back of your ST.

And of course, the ST uses the standard Atari-type joystick. By the way, Sega Genesis control pad and arcade sticks work, but of course, they have extra buttons Atari doesn't recognize.

Has anyone connected the EZ-Flyer to an Atari? I am considering it for my Mega, and you can't beat the price, $129 for 230 Mb. Hell, even with a SCSI adaptor, that's a better deal than the Megafile 60s or older Megafile 44s out there.

I'm assuming that you use standard Atari hard disk partitioning software?

>to get Metados to drive both (can it drive both?).

MetaDOS itself runs on "everything", because it is just a GEMDOS extension
to load device anf filesystem drivers. The free MetaDOS release from Atari
does not contain BOS drivers for IDE or Falcon SCSI, but there are other
third party drivers that do. AFAIK, the CDR software comes with a BOS
driver which works with writers on Falcon SCSI.

I don't know whether MetaDOS and Extendos will work together, but you
might also consider not to install a driver for the CD writer at all.
The CD writer applications access the drive directly, so you really don't
need to install an OS driver if you don't need to see the drive outside
the CD writer software.

If you *do* want to go to a MetaDOS based system instead of Extendos,
try SPIN! (http://www.muenster.de/~reschke/soft_e.html).

Not that I know of. However, there are hacks to add a 2nd serial port to
the ST by diverting a MIDI port. You can switch from MIDI to Serial2, as
you will hardly ever be using MIDI and the Modem at the same time. Look
for a text file describing the mod on the usual FTPs or at:
http://www.geocities.com/SiliconValley/Way/8016/sthard.htm

Cheers,
Nick

Same as a ZIP, ZIP+ or any other SCSI Harddrive.
SCSI-Cable, Host-Adaptor (if you have an Atari without SCSI) the

right termination and a Harddisk-Driver. (I don't talk about AHDI..)!!

>I'm assuming that you use standard Atari hard disk partitioning

Hi!

> as the TT 030 has a 32mhz chip is it possible to the the 030 in the
falcon
> to run at 32MHz by overclocking it or something?

Yep!

I�ve modified my F030 slightly to support higher clockrates. It is quite easy to increase the bus/cpu speed to something like 25mhz (requires 60ns memory chips though).. With a PowerUp module you can increase the CPU clock further to 40 or 50mhz but in that case you�d better change the 16mhz CPU to a 32 or 50mhz one.

If you don�t want to do these hacks all by yourself there are several speeders available, for example the Nemesis board.

That doasn't work well, use MetaDOS - O R - ExtenDOS.
I try that few days ago with a yamaha CDRW 4260t.

>The CD writer applications access the drive directly, so you really don't

Right. ExtenDOS also have support for a simple SCSI CD-ROM devices.
(IDE i don't know)

SoundPool's CD Recorder 2.2 allways had his own driver.. ;/

Regards, Robert

My 520fm is unable to access disks. The drive is getting power and is
doing a little bit of work to find the disk. Always I get: "Drive A: is
not reponding. Please check the disk drive, and insert a disk..."
A couple weeks ago, I bought an SF354 drive without any connection or
power cables. I open up the Atari and put this drive in the place of the
other one...same problem.
I can't even format a disk on the Atari!

Any insight you could give me would be greatly appreciated.

The Am76C60 is the well-known C-LANCE, an improved version of the LANCE Am7660, a better choice than the 76C960. Reason is that there exist several Ethernet implementations for the Atari ST line using the LANCE, and drivers exist for MiNTnet and STinG. Slightly different bus interface can be easily catered for in those drivers.

Cheers Peter

In Germany, a TT version of the PowerUp 2 is (was?) available. The
PowerUp 2 is a clock doubler for the Falcon. Chip clocking the TT
is pretty easy. Basically you do all the mods just as you would if you
were modifing a Falcon with Peter Greens CPU_ACCEL document. There are
a few different connections to make, but it can be done for the price
of a new clock. I have ran my TT up to 44Mhz this way, but the SCSI
bus becomes unusable. The DMA and Link worked fine however. Over 44Mhz
and I began to have Video problems.

Mike

Is that possible ? If so, maybe you could supply explanations on how to do it.

It is possible to rewire a PC Bus mouse, but these are even harder to find than ST mice.

Cheers,
Nick

Hi Mike,

You didn't say if they were emailed or sent on a floppy. If they were emailed to you, and your using Newsie for your mailer, you need to select the option extract binaries. If they were sent on a floppy, then you just need a picture viewer to display them. Photochrome 4 and Speed of Light are available on most Atari FTP sites in the graphics sections. Each will display an image of millions of colors on an ST pretty decent. If the jpg is to big, you will run out of memory with only one meg, but jpgs (small one) are usually not very memory hungry. Both display GIFs too I believe. Also the disk your friend sent should be formatted at a 720K PC disk, not the HD type (1.44mb).

Regards,

Mike

Not quite on the same tack but you can hook up a ol d DEC VT220 keyboard to the ST with just a simple connector. If I recall it does work but there are one or two keys which are missing. All you needed was a program called DECKEY to pick up the stuff from the serial line and feed it to the keyboard input.

Regards
Mike

Hi Noah!

Sounds as if the problem is somewhere between the Floppy disk controller WD1772 and the DMA chip. Usually both of them are not cheap, not socketed and therefore hard to replace (though I did it several times...).

But first you can try other drives and perhaps an other 34-pin ribbon cable...

Greetings,
Carsten

Hi!

I�ve got a PowerUp2 module installed in one of my Falcons and want to install another one in my other.

Does anyone know where to get one these days? (Preferably in Sweden)

 ib> I have a couple of old STs (no keyboards) Is it possible to 'retro'
 ib> fit these with
 ib> PC keyboards and attach a mouse somewhere else? (hobby project)

Yes. Give The Upgrade Shop a ring, they sell a module that will allow you to
do this - however you will need the keyboard processor chip.

The mouse and joystick plug into connectors on the module.

Speak to 'ya later!

Hi,

a while ago I configured my Falcon as a small Intranet server, with Mint & MintNET. Everything worked fine : I can attach a Mega ST, Falcon or Powerbook with MagicMac to the server's RS-232 serial port. I use the MintNETv2 HSMODEM package for the drivers. Now, I can make raw terminal connections (with getty) to a Falcon or Powerbook over the LAN port (RS-422), but it was impossible to get a working SLIP connection (PPP-connections from server to client never worked BTW).

It seems (when I analyse the traffic) that the SLIP connection is initiated, but then the server goes berserk : all incoming packets are errors and the sld starts hogging CPU time.

(On the client-side, things were configured with the ASH TCP/IP package, I believe it is called PPP-Connect ; anyway, it's the one you get with CAB)

Does anyone know the reason for all this ?

Thanks for reading,

Only if you help us out !

I am currently working on issue 3, We have had some new members to support the new zine but I am sure there are a lot of you out there how would like to write somthing.

If you would but dont know how, then write a articles for the WIBBLE section of MEGA. Simply keep typing the first things that come into your head for a line or 100, and mail it to me.

Have any ideas on stuff to include, I like to hear from you.

Sorry to all those people who are waiting for MEGA to appear on my site, It should be there shortly. I will mail it to people who request it.

If you have already got MEGA, Make sure you have got the disc_1a.zip and disc_2a.zip files, The ones without the "a" are a faulty version. This was mailed in a almighty cock up on my part. The main problems are bottoms of files missing, a few not on the disc and the music will not turn on if you turn it off.

Anyone who I sent my questionnaire to , all have now been removed from the mailing list as they have not given permission for me to keep them on recored.

Please take a few moment to send your support to MEGA, I know there are a lot of readers out there, so Keep the mag going and offer your help. Support you ATARI computer, don't hide behind your keyboard, let the world hear you !!

ATARI FOREVER

Both display GIFs, but PhotoChrome does not display JPGs. You need to convert them to something like GIF or TGA first. TGA would be best, as GIFs are limited to 256 colors. Of course, as long as it's already in TGA, you might as well use Apex's TGA viewer, which displays at least thousands of colors on all Ataris.

I'm using the flyer on my TT, and it worked well out of the box. Get the PC formatted version. (Found mine at a Best Buy closeout for $99.00) On the ST you would need a link. The flyer is self terminated.

>
>I'm assuming that you use standard Atari hard disk partitioning
>software?

I gave up AHDI for ICD, then HD Driver. They are both faster and more flexible than AHDI. If you use HD Driver you don't have to do any partitioning. Then your cartridge would also be directly usable on a PC. (That my be true for AHDI too, but I can't remember.)

I've only had mine since Christmas but it's working great so far.

Subject: How to transfer Tape TAR file to Disk (without extracting files)
Date: 1998/04/02
Message-ID: <6fvg2j$rk4@bcrkh13.bnr.ca>#1/1
X-Deja-AN: 340130217
Organization: Nortel Ireland Ltd
Newsgroups: comp.sys.atari.st.tech

HI

I have a tar file (approx 100 MBytes) on tape that I want to transfer to my STFM. I normally use Tapebios with GTAR, which works well.

For this particular tar file, which was created on a MAC, there are a lot of files with very similar names. I extracted the TAR file into a Minix partition, but many files were not written to the disk because they had the same first 8 characters as other files.

I figure GTAR (it's an old program, based on TAR 1.10) is not Minix/MiNT aware, the newer TAR programs might be able to extract the full names.

I have tried to pipe the output of GTAR to TAR, but this does not work.

Is there any way to copy the Tape TAR file to disk without extracting the files?

I realise part of my problem is my tape setup, i.e if I had a proper tape driver & the tape was installed as /u/dev/tape, then I should be able to cp from the tape to the disk.

Unfortunatly, I have not been able to find a working MiNT tape driver.

What exactly is TOS 1.09?

From the late 1980s, British Atari mags frequently mentioned TOS 1.09,
but, AFAIK, there never was a TOS version labelled 1.09.

From descriptions of it, I am led to believe that it is really TOS 1.02
"Blitter TOS" (or "Mega TOS", if you prefer)

Can anyone enlighten me as to where the moniker "1.09" came from?

AFAICR, none of the internal version numbers (AES, GEMDOS etc) in that TOS version were 1.09, so it is unlikely to be a case of transposed version numbers.

I seem to remember seeing this in an ST Format once, but it'll take me ages to sift through all the feedback/STA columns. I think that it was just another (wrong) number for a TOS version, or a TOS version that was never released.

It doesn't exist as v1.09 anyway, but apparently some programmes had trouble detecting certain TOS versions...

Hi Guys,

Okay, here's the latest on my Zip woes - to recap, I'm trying to get a Zip Plus drive to work on the SCSI chain after my Link 2/MiniS hard drive.

Ok, I got my SCSI terminator block, and connected that to the other SCSI port on the Zip+. The Zip+ is recognised perfectly, and works perfectly, I can format, read/write files etc. But the MiniS no matter what will not work on the same SCSI bus when the Zip+ is connected (yes, they are both set to different ID's). It works fine on it's own (termination enabled), but when the Zip is connected after it and the MiniS is unterminated, the SCSI communication between the computer and the MiniS is way unreliable, even though the SCSI commands being passed on to the Zip+ work fine. I've tried every possible combination of DIP switches on the MiniS and nothing improves matters. Help!

With the Zip Plus connected, the SCSI communication works fine with the Zip+, but is extremely unreliable with the MiniS. Both HD Driver 7.1 and the ICD 6.5.5 driver software read garbled data - for example, in normal use the driver software reports that the MiniS is a "Maxtor 7213-SCSI" drive, which is correct. With the Zip plugged in, this usually is reported as something like:

"Maxxrr 7343/SSSI"

or   "MXXor 7724--SSIO" or other garbled text
(it's different every time)

indicating something is seriously wrong with the SCSI communication.

(I haven't yet tried connecting the Zip+ first, then on to the MiniS
yet because of the cost of the leads, but that may have to be the next
thing to try...)

Anyhow the disk drives are the same. The difference lies in software or
controllers.

The TOS version I think you are on about, is the disk based version
named as TOS 1.09. I use it every now and then to get some programs
running on other St's that wouldn't usually run.

I can't remember why it was called 1.09 though. If you have come
across program that do not run on STE's, 1.4 or 1.2 machines then try
using the disk based TOS:)

If you want further info, let me know.

Cheers! for now
               Steve

My french 1040 STF has a TOS 1.09. It can support a blitter, and it's not a STE TOS. It's the last TOS especially for STF.

Will it be posible to connect 2 internal hd to the same psu?
I have 1 extra 120 Mb hd, the original 2.5 " IBM/Conner model, with
the same model number.

Hmmm just a thought: this Zip+ is the one with both a // and a scsi
interface, isn't it ? So there should be one connector for the scsi port
and the other for the // one. Am I wrong or did you plugged a terminator
in the // connector ? I would be surprise if it works.

(I could be wrong of course as I only own an ordinary internal scsi Zip).

> (I haven't yet tried connecting the Zip+ first, then on to the MiniS

If what I said is right, it should not be possible to chain a scsi
something after the Zip+.

Bye,
/Pascal/

No, the jumpers provide continuity to the external ACSI port when the internal host adapter is not installed.

This is one clear-cut case of SCSI termination problems. Use short cables (leads?) and make certain that the first and last items are terminated (it sounds like you have termination at the end O.K. -- put it at the beginning as well with either resistor packs or a pass through terminator). I went through this garbling for months a couple of years back before figuring it all out -- not I have 4 items on my SCSI bus and they are all happy.

Curiously enough, there should be one for the Falcon in one of the DSP
example code archives at ftp://ftp.lip6.fr/pub/atari/Falcon/Programming
Or you could use WinRec.

Don't ask me how I know this, as I have nothing to do with Karaoke... :-)

It should be. I use an internal Amiga diskdrive in my BBC Micro (!), which is fitted with a WD1770 expansion. You'd just have to find a way to connect the thing, as external Atari diskdrives use pretty weird connectors IIRC. But as longs as you connect the right wires to the right pins, there should be no problem...

>SCSI port on the Zip+. The Zip+ is recognised perfectly, and works

A ZIP+ terminate automatically if his second port is OPEN eg. the ZIP+ is the latest device on the SCSI bus.

>perfectly, I can format, read/write files etc. But the MiniS no matter
>what will not work on the same SCSI bus when the Zip+ is connected

Sure, double termination..

>(yes, they are both set to different ID's). It works fine on it's own
>(termination enabled), but when the Zip is connected after it and the
>MiniS is unterminated, the SCSI communication between the computer and

Switch on TermPwr (Jumper from the SCSI Device in your MiniS)

ANY ZIP drive MUST have TermPwr from Host or ANY other SCSI device.
Without TermPwr (Pin 38 SCSI) the ZIP can't terminate the bus well.

Also Parity..

```
>                          "Maxxrr 7343/SSSI"
>or                        "MXXor 7724--SSIO" or other garbled text
```

Pure SCSI communication errors..

Check wireing and termination again!!

>indicating something is seriously wrong with the SCSI communication.

Right.

Regards, Robert

```

This all sounds like a problem with termination to me. I've seen a very similar problem that happened because of incorrect termination. Also remember to set each device to a differend ID (although I think you must have done that or you wouldn't have got this far)...

Is anybody out there still interested in ringing Atari Bbs as I Have one
that is offline at the moment and if anyone is interested in ringing it
I would put it back up again as I have a good selection of pd programs
on st format disks etc as well as some cdroms that I have purchased from
overseas
I live in Auckland New Zealand and if anyone is still interested in
ringing Atari Bbs's you can call me on 0064 09 2756454. after 6pm or
email me as my email address is cgbohm@ihug.co.nz.

]-
]-It should be. I use an internal Amiga diskdrive in my BBC Micro (!), which
]-is fitted with a WD1770 expansion. You'd just have to find a way to connect
]-the thing, as external Atari diskdrives use pretty weird connectors IIRC.
]-But as longs as you connect the right wires to the right pins, there should
]-be no problem...
]-
]-   -=Levien

Hmm...I'm wondering about the power supply as well...don't most external
Amiga floppy drives draw their power from the drive cable rather than from
a separate power supply? I remember the one I had did, thought it was
missing parts at first...! ;-)

```

First of all, please excuse me for cross-posting this but I thought it concerned all Atari owners. ST Informer Magazine is set to return soon in Web format. Many previous subscribers probably know that ST Informer's web site has been stagnant for awhile. Well, I have just been appointed Web Editor of ST Informer and hope to change all of that with monthly issues of ST Informer. Issue 98 will be posted shortly. For those who want to be kept updated, please send me an e-mail and I will add you to the ST Informer mailing list.

What will ST Informer include? I plan on having letters, Rod's trademark Potpourri column, news, interviews, and product reviews. What Atari products will we cover? All of 'em with a focus on the computer line. This will include pictures (though they will not be bandwidth-busting). There will be no Java or animated GIFs so that we can concentrate on the information and to make this site available to all (even those with slower modems like myself).

This, of course, cannot be a one person show. First of all, I don't own all Atari systems. Secondly, I just don't have the time to write all of the articles, lay out the pages, etc. I am asking for volunteers interested in writing for the magazine. The benefits include, er, fame and, um, prestige. Seriously, it is fun and those willing to put in the time will be first considered for review products from vendors. All submissions are welcome so please send your articles to me at stirrell@portland.com.

For advertising information, please send requests to Rod McDonald at stinformer@chatlink.com. He will be happy to send out information. Also, to get your products reviewed, please contact me atstirrell@portland.com. I will make sure that they get to a reviewer as soon as possible.

If you have any comments or suggestions for ST Informer Magazine, don't hesitate to write to me. I really want to hear from you and, as a community, make this new venture a success for all Atarians.

Sincerely,
Scott Tirrell

I have a selection of Atari ST titles for sale.

This List Updated 20/3/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be responsable for in accuracies.

I have some 1 meg SIMM's ideal for upgrading your STE or Extra RAM Deluxe upgrade board.

Upgrading from 512k or 1024k/1 meg to 2 meg .... 12.50 UKp (Sterling)
Upgrading from 2 meg to 4 meg .... 12.50 UKp (Sterling)
Upgrading from 512k or 1024K/1 meg to 4 meg .... 22.50 UKp (Sterling)

Along with the memory, you will get fitting instructions and a disk of utilities.

Sorry, UK and Europe ONLY.

Cheers! for now
Steve

Hi Folks,
I'm looking to record my songs using my Falcon, and I want to be able to back-up and write to CDR. I'll be getting Soundpool CDR software and a Phillips 2600 unless something better comes along, but I'm a bit stuck for recording software. I have Clarity Falcon, which uses a DSP-port dongle to get 44.1kHz (the Falc can't do it itself), and I understand that 4T/FX, which I'm planning on getting can also do 44.1kHz if given an external clock from, for instance, the Soundpool/Steinberg FDI. Does anyone know if the Clarity clock dongle can be used to let 4T/FX record at 44.1kHz? Or if it doesn't, is there a cheap alternative out there?
Many thanks for any replies,

chrisc

>STE TOS. It's the last TOS especially for STF.

What are the differences between your TOS 1.09 and rainbowtos (1.04)?

Greetings
Markus

: Even with the fastest settings of the SCC-Ports, which is 230 kbps, and which
: works hardly reliable given the 4 byte buffer and CPU speed of Falcons, is
: by a *factor* of 44 slower than Ethernet, which makes 10 Mbps ! So a serial

Correction. This is a common mistake in concern to IEEE 802.3 (e.g. Ethernet)

The bandwidth 'on the cable' is 10 Mhz, and using Manchester encoding with bit violations, one could achieve near 10 Mbps. However, due to collisions, which are unavoidable in TCP/IP traffic, the effective data rate will never be this high. All the collision handling should be done by the hardware, i.c. the Ethernetadapter, and it should only generate an interrupt when a frame arrived for the user of the adapter.

Considering all this, the effective datarate lies far below the 10Mbps limit, but maybe still to high for a serial port. This could be solved using onboard buffering or smth like that. Anyway, a network card with a serial port is a nice idea.

: to Ethernet adaptor can't be anything but a bad kludge.

...but one could ask why this hasn't been done before...

The pin out of the Atari monitor port can be found in the Atari manual and as with the pin outs for the SCART sockets, have you tried Maplin catalogue.

If you still have no joy, let me know and I'll try and get them for you:)

Cheers! for now
               Steve

Check out the Quick FAQ. You can use a PC serial mouse on the ST's serial
port with a small driver program, like mouse25.prg. It can be found on most
FTP sites.

Cheers,
Nick

No, an SVGA can only display ST High res. Check on the scan rates first
though. You'll find them in the Quick FAQ.

```

I need to contact an user of a MEGA STE 4 with german keyboard, or even
better with an french/suisse keyboard (clavier franco/suisse =
qwertzuiop ��, ��, ��, �).

I need help on the TOS of this computer.
Even if you are only an owner with no special tos experience please
contact me at:
gerard.biever@ci.educ.lu

Thanks

Greatings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there.

www.users.globalnet.co.uk/~mega01/

Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

If you would liked to be mailed issue 2 then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Mail me at. mega01@globalnet.co.uk   Now for issue 2.

Chris Swinson.

Trying to tramsfer my Atari-txt-files to a PC for laser printout I lost
several characters.

My ATARI is an MEGA STE 4 with french keyboard, the PC has French/swiss
keyboard. The changed characters are special french characters only like
� � � they are replaced by other ones.

Hope that somebody has an idea how to get the right characters or to
transcript the atari txt files.

Thanks

Hi,

Your Atari friends should be able to read 720kb DOS Disks, If it is a falcon it can read 1.44mb DOS disks.

The Atari ST has a 720kb floppy drive, for disks to work in it they have to be formatted as 720kb. An ST can allways read undamaged 720kb disks, but PCs cant always
read 720kb ST disks, format oon your PC to be safe first.

If the problem persists and the file is too big for a 720kb floppy disk then you need some software called GHOSTLINK and a LapLink cable (cable to connect modem port on PC to the modem port on your atari) Your friend really needs more than
1mb of RAM and a hard disk for this really.

GHOSTLINK and full instructions are on my website.

It is a zip file, if your friend doesn't have ZIP then you's better get the STZIP program there too.

my site is at

http://www.geocities.com/siliconvalley/lab/8261/index.htm

The files are in the downloads section somewhere,

Ian Norton (newt) :)

I guess you're referring to the often-told 40 % limit. This limit does not really exist, it's a fairy tale. Even on a heavily loaded Ethernet (i.e. many stations) 95 % of the theoretical limit can be reached with modern networking hardware.

>: to Ethernet adaptor can't be anything but a bad kludge.

Because there is no need.

Cheers Peter

After many nights of soul-searching sleeplessness I've decided to part with two of my Falcon systems. Both work flawlessly, and I'll guarantee they do or youmay simply ship them back within three days. If you need to mix/match or are interested in the pieces I'll consider offers but the best price will go with a package sale. So, here they are:

Two Atari Falcon 030 computers, each w/14megs of ram, 80meg HD, and all necessary audio mods. One is in a Wizztromics rack (3 sp.)with a zillion ports and PC-compatible external keyboard and is further housed in a 4-space Calzone flight rack, while the other is a standard Falcon (all-in-one unit).

SMP 11 2in/4out MIDI interface w/SMPTE

FA8 Adds 8 analog outs to the Falcon

Cubase Audio Clock Allows Falcon to use 32khz, 44.1kh, 48khz audio files and hear/edit them at proper tempo/pitch

Falcon Digital Interface Adds digital ins/outs to the Falcon

Two Color monitors (15")

External CDRom (4x)

Two external 1 gig scsi hard drives

CDRom (2x) and Syquest 44 drive with one cart housed in external case

14.4 fax/modem

Micro MidiMacman Adds another midi out to the Falcon via the LAN port

Falcon Colorburst hand scanner

All cables/mice/etc. necssary to connect each of these items is available

Now the software:

Cubase Audio Falcon 2.06 16 tracks of simultaneous audio

Two copies of Logic Audio Falcon 2.01; each comes with the LOG3 interface
(adds 3 more midi outputs to the Falcon)

CDs:
Crawley Crypt 1, 2
All Things Falcon
Atari Public Domain and Shareware

ICD Pro utilities 6.5.5

HDDriver7.12

Pagestream 2.2

Extendos Pro

Stalker 3

Neodesk/Geneva

Two copies of Warp 9

Publishing Partner

XBoot 3

Screenblaster 2

Atariworks

Diamond Back 3
Diamond Edge 2

Imagecopy 4

Many graphics programs, wordprocessors, etc.
Tons of disks of games/shareware/etc. These will go with one of the

systems.

I want these systems to go to someone who cares about a fine tool, who understands exactly how cool these actually are, so if I can help by answering questions via email that's perfectly fine with me. Also, if you buy a system and don't understand something you are free to call me anytime and if I can help I'd love to do so. I know, tech support--wild, huh?!
All items are best offer, and I want to sell ASAP, so you'll have to ride the line between giving a fair $ amount vs. my timeframe for sale (by the end of April). Thanks in advance.

I have an Atari Lynx, and the controller is stuck so that it pulls to the left. I am unable to play anything with it. I would like to know if anyone has had this problem, and if so was it worth getting fixed. I tried one place, and they told me no. Maybe they just couldn't be bothered.

It won't be easy finding anyone who is able to do repairs but if anyone says it can be fixed at a reasonable price I will certainly start scouring the telephone book for a repairer.

I thank you for your time.

Well, I checked that Atari Web Ring, and the
closest I got was Vezz's home page. There were
several hardware modifications listed, but
nothing regarding fast-clocking the DSP.

Hello Ben,

Sure, this has appened to all 4 of my Lynx units :-(
but it can be fixed quite easily by yourself
(my Lynx are working all right since I did it years ago)

Work on a very clean area.
- remove the Lynx2 black rubbers using a large screwdriver,
  (the glue is good for this purpose)
- remove the 4 screw under those rubbers,
- remove the batteries and the screw in the batterie area,
- open carefully the unit,
  (note how to replace all together afer)
- you have to remove the screw fixing the screen unit too,
- you can work without deconnecting the connector,
- remove the last crews to access at the paddle,
- just clean the contacts with alcool, that's all it need,

- do carefully the back process.
  (be sure not to add dust under the screen)

Hope you'd manage this, or give this note to a
radio-tv specialiste.

At least with CDTOOL or SPIN! this is no problem. One of my CD-ROM
drives is set to 512 bytes per sector. That is what the Sun needs and it
also works with my Atari. My other CD-ROM drive has the normal (i. e.
2048 bytes per sector) settings and this also works.

> floppy-disks?

I think it depends on the atari computer your using. I use a mega/ste and I transfer files between my dos machine and the atari all the time. I usally format the disk in the IBM. I find the only times it don't work is when I make directories on the disk or delete some files from it. If you could fromat the disk in DOS format copy the file to it and do nothing elase it might work. Also, I think there are programs out there which allow atari computers to read dos formated disks. Don't hold me on that though. If you've got internet access search some of the shareware search sites.

Scott.

I have a disk box, its an 80 or 100 capacity box approx., with software on their original disks. All but three have NO boxes, some have instructions, some don't. There are around 44 software titles, some need instructions & some don't; some are one meg program, e.g. Lemmings 2 'The Tribes', some arn't.

The whole lot weighs in at 1.8 kilos.

Now the important bit, The price. 30 UKP
Including Postage. (UK Only)

Cheers! for now
Steve

Whether it's worth fixing or not is down to you! :-))

It's not too difficult to strip a Lynx 1 down and take a look at the contact points for the controller pad - the problem I had with mine turned out to be due to the pivot point of the controller which had worn its way through the PCB track leading from one of the contact points. Fixable by soldering a wire but definitely a case of poor design.

If you need parts try Brad at Best Electronics (bestelec@concentric.com), if you decide to replace the unit then try http://www.vglq.com - both Stateside concerns.

Also try joining alt.games.lynx where you'll find the (fairly regularly posted) FAQ that has some useful info about taking the Lynx apart.

Actually, your best bang for the buck (if you don't already have your
Falcon in a tower) is to get a higher rated power supply from Best
Electronics.

Newsgroups: comp.sys.atari.st.tech

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site
and download it from there. Also UFOST issue 1.

There has been a few bug reports mailed to me so this issue is the NEW
version, V1.1
Bugs are mostly end of files been cut off and a few files which were missing
off the disc. A few other Shell bits have been updated as well.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about
everything we can think of. There should be something there for everyone.
If there isn't then why not write about it or suggest new pages. If you
don't then we won't know will we !!

Also UFOST issue 2 is available, Dedicated to UFO's abductions and
sightings. Not to be missed if you are interested in this type of thing.

This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail in the coffin for ATARI. Any articles are welcome, If you have idea on one
why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Please support MEGA NOW, If we don't get some REAL support for issue 3 then we may not produce another zine, Its up to you .

If you would like to help but don't know how then please feel free to ask me waht you can do.

From Chris Swinson (MEGA DISCZINE)

http://www.users.globalnet.co.uk/~mega01/

```
Hi-

I bought a SC1224 monitor at a flea market and see it has a round
connector, while the back of my falcon has a DB15 male connector. Obviously
there is an adapter that is needed...

I would like to make one... Is there any kind of Falcon FAQ available? I
saw the ST FAQs and it seems that they lack the technical details I need
for pinouts, etc.

Is there a definitive Falcon website I should know about? I'm sure I will
have LOTS of questions once I get this puppy fired up :)

If there is none of the above could someone tell me the pinouts and/or
forward and docs they may have about the video adapter and it's
fabrication?

Thanks very much!
Roagie

It's available from your Atari dealer for about $10. to $15.00.

>Is there a definitive Falcon website I should know about? I'm sure I will
```

>have LOTS of questions once I get this puppy fired up :)

There are lots of sites, with several ways to find them:
1/ Head for a major search engine such as Debriefing
http://www.debriefing.com and type in +Atari +Falcon +Computer
and see what comes back.
2/ Hop on the Atari Webring ... you could start at my site,
http://www.tmisnet.com/~strads/hq/atari.html , and visit many
of the 113 sites available.

>If there is none of the above could someone tell me the pinouts and/or

Oh, you should be able to find it if you REALLY want
to make one.

You have allways the chance to take doitf030.diz (ASCII Text) BEFORE you take
any archive. Also check if you need the add on.

(Perhaps you could make an update or patch
>available for those that have earlier versions?)

Well, that's a time problem. The compiler create only the hole archive
in neary one hour. If anybody have the time, he can filter the newer parts
and can create patchfiles, one per month, storeable at his own site.

You dit'n found the splitted parts (V 6.0.1) on my site?

One men, two hands, and one pair of..
20 Hours per month, for realy - - nothing - -
More questions about?

 >> send 5 HD floppy, one ZIP or an empty CD-R <<

>*NEW:* Also, any chance of splitting these files up into sections that will
>fit on HD floppies, say? A friend downloads them from me at work and wants to
>put them straight onto floppy, not the firm's hard drive --and has no easy

Next release contains some eye glasses as - FreeWare - :->
You can take 5 smaler parts, no extra sections, read upper.

http://www.rhein-main.de/people/robert/download.htm

Steve,

Another thing I would suggest is turning off the internal terminator,
chucking the passive terminator, and putting an _active_ terminator at
the end of the chain (CD-ROM).

Dan

For a quick start, go to Hallvard's launch page, you find just about
anything there, links galore for the Atari line, and tell Hallvard
thanks:

Sure, but there are other things on the address bus as well you know like RAM, ROM hardware resgisters etc. The address bus is only 24-bit so it looks like this.

```
 _______________
| 680x0 vectors | $00000000
|_______________| $000000FF
|               | $00000100
|  ST-RAM 14MB  |
|               |
|               |
|_______________| $00DFFFFF
|               | $00E00000
|      ROM      |
|_______________| $00EFFFFF
|               | $00F00000
|  Hardware #1  |
|_______________| $00F0FFFF
|               | $00F10000
|   Expansion   |
|      port     |
|_______________| $00F9FFFF
|               | $00FA0000
|  Hardware #2  |
|_______________| $00FFFFFF
```

You can ofcourse use the area where the top 10Mb of ST-RAM is located if you have got only 4MB ST-RAM. If you use the PMMU in some clever way I guess you can expand the area as well.

> > So what are you going to do?

Hi

Please - someone help me....

My Falcon is now connected to an old colour TV and I have come across a problem - some Falcon games will not run on the TV - the screen just scrolls truly madly and deeply. :(

The games worked fine on a SVGA monitor, but the monitor is currently bust - so I have to make do with the TV.

Any ideas of what I can do to fix this problem?

Regards
Danny

  Hi Danny! Well, some (a very few) will only work on VGA/SVGA. TBH, most
  Falcon games want RGB, though. Are you using the TV adaptor? You are in
  Europe so its 50 instead of 60 cycles as well, right?
```

My first recommendation would be to have an SC1224/1435 handy. <smile>
If thats not possible, how about listing each problem game so that we
can identify whats going on? Will be looking for your post/mail! ;-)

Since my original posting of help with getting my CD-ROM drive up and
going, I will explain what happens with what in the hope that someone
can tell me what the hell I'm doing wrong:(

The Drive is an APPLECD 300, with a SONY 8003A mechanism.
The Atari STE's are 4 meg TOS 1.62/2.06 & 4 meg tos 1.6 (1.06).
The external hard drive is System Solutions MiniS 127meg hard drive.
Using the ICD Link II.

The hard drive has inbuilt SCSI terminator, the CD-ROM has an external
passive terminator.

Now on their own both drives work OK in all versions of TOS available
to me, with the exception of the cd-rom drive. I am able to read the
directory of 'All things Falcon' CD and none of the 'Northern CD-ROM
Series Germany' using TOS 1.62 & 1.6, in which case the ST crashes.

Using TOS 2.06 I can read ALL the directories of the cd-rom drive; I
can run some programs from the Falcon CD (obviously not all of them on
an STE), but when I try and run the INSTALL program on the NCS cd's
the ST bombs out with a BUS ERROR (odd address).

When using the Hard drive, termination is internal. The rom drive does have the external one that came with it.

Linking/chaining them together under 1.62/1.6: As recommended by Sytem Solutions, ST - CD-ROM drive - hard drive.

The hard drive refuses to auto boot, and so floppy disk is required to boot. When booting I lose partitions of the hard drive e.g. E, F & G. The rom drive is detected and installed.

I can read the Falcon CD but again the system crashes when I try the directory of the NCS cd's. Access to the hard drive is not secure.

Changing the order to as follows: ST - hard drive - CD-ROM drive with terminator plugged into rom drive.

Again I have to boot from floppy, and the driver software displays garbage instead of the hard drive 'Quantum' type but no partitions are found. The rom drive is displayed correctly.

Accessing the CD-ROM's are identical to above under 2.06.

I don't know why the hard drive loses partitions when the rom drive is connected; this happens with all packages and drivers I have tried. Also why it crashes when reading any of the NCS cd directories in 1.62/1.6 and bombs out under 2.06 when using the NCS cd's.

I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard drive. And for the rom drive; Extendos pro, spin 34? (the latest one), metados 27. Extendos pro being the best tried.

Is there something I've missed. I'm ready for sticking my head down the toilet and flushing it, or giving myself a brain wash for short!

Any help would be more than appreciated.

Since my original posting of help with getting my CD-ROM drive up and going, I will explain what happens with what in the hope that someone can tell me what the hell I'm doing wrong:(

The Drive is an APPLECD 300, with a SONY 8003A mechanism.
The Atari STE's are 4 meg TOS 1.62/2.06 & 4 meg tos 1.6 (1.06).
The external hard drive is System Solutions MiniS 127meg hard drive.
Using the ICD Link II.

The hard drive has inbuilt SCSI terminator, the CD-ROM has an external passive terminator.

Now on their own both drives work OK in all versions of TOS available to me, with the exception of the cd-rom drive. I am able to read the directory of 'All things Falcon' CD and none of the 'Northern CD-ROM Series Germany' using TOS 1.62 & 1.6, in which case the ST crashes.

Using TOS 2.06 I can read ALL the directories of the cd-rom drive; I can run some programs from the Falcon CD (obviously not all of them on an STE), but when I try and run the INSTALL program on the NCS cd's the ST bombs out with a BUS ERROR (odd address).

When using the Hard drive, termination is internal. The rom drive does have the external one that came with it.

Linking/chaining them together under 1.62/1.6: As recommended by Sytem Solutions, ST - CD-ROM drive - hard drive.

The hard drive refuses to auto boot, and so floppy disk is required to boot. When booting I lose partitions of the hard drive e.g. E, F & G. The rom drive is detected and installed.

I can read the Falcon CD but again the system crashes when I try the directory of the NCS cd's. Access to the hard drive is not secure.

Changing the order to as follows: ST - hard drive - CD-ROM drive with terminator plugged into rom drive.

Again I have to boot from floppy, and the driver software displays garbage instead of the hard drive 'Quantum' type but no partitions are found. The rom drive is displayed correctly.

Accessing the CD-ROM's are identical to above under 2.06.

I don't know why the hard drive loses partitions when the rom drive is connected; this happens with all packages and drivers I have tried. Also why it crashes when reading any of the NCS cd directories in 1.62/1.6 and bombs out under 2.06 when using the NCS cd's.

I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard drive. And for the rom drive; Extendos pro, spin 34? (the latest one), metados 27. Extendos pro being the best tried.

Is there something I've missed. I'm ready for sticking my head down the toilet and flushing it, or giving myself a brain wash for short!

Any help would be more than appreciated.

Unplug the external terminator on the CD Rom drive when both the HD (with internal terminator) and the CD-Rom drive are chained together... this is most probably the problem...

As for the NCS ROMs - dunno... I never got round to using them. :(

What TV adaptor? I have an RF cable coming out of the Falcon straight in to the TV.

Could be the Hz cycle - is there any program to fix this? I remember

there was a program on the ST which allowed you to do 50 or 60Hz on
the touch of a keystroke.

The N.C.S CD-ROMs have an faulty install program! It only runs on 68030 machines. There is an update/patch version that works on every ATARI. I can mail it to you.
THIS IS NOT A FAULT OF YOUR CD-ROM DRIVE!!!

> When using the Hard drive, termination is internal. The rom drive does have the external one that came with it.

> Linking/chaining them together under 1.62/1.6: As recommended by Sytem Solutions, ST - CD-ROM drive - hard drive.
>
> Changing the order to as follows: ST - hard drive - CD-ROM drive with terminator plugged into rom drive.

I don't know about the termination of the LINK adapter.
Generally you have to terminate the devices at the very ends of the SCSI cable. That means in your order the LINK has to have a termination, the CD-ROM must not have one and the hard drive has to.
Or, if the LINK has no termination, you have to put it between the two other devices and terminate both.
I can read the Falcon CD but again the system crashes when I try the directory of the NCS cd's. Access to the hard drive is not secure.

> I have tried HD driver 3.1, ICD 6.5.5, and CBHD 5.04 for the hard drive. And for the rom drive; Extendos pro, spin 34? (the latest one), metados 27. Extendos pro being the best tried.

Try to get a newer HDDRIVER version (7.5 is actual, 7.0 is OK, too).
SPIN 0.34 is the best you can get.

Bye,
Carsten

What do you mean by inbuilt? Does it have resistor packs or a DIP Switch?

With the CD-ROM itself you are getting bombs? Try a few music CDs -- is your
CD-ROM reader O.K.?

This would hint at either bad termination or bad cables.

Clearly your problem is not software (I am assuming that you have no other
auto or acc running during your tests). I would try your hardware on another
computer, for if termination really is O.K. (DON'T trust DIP switches!) and

your cables really are good, it is possible to have bad circuit boards that can't handle multiple drives. Make sure your cables are good and your CD-ROM is not bad and get back to me.

Galen (Head YACcer, Yolo Atari Club)

]-What TV adaptor? I have an RF cable coming out of the Falcon straight
]-in to the TV.

Hmm...here in the States, you have to have a little "box" that sits between your Falcon and a TV. Its called a RF-Modulator...I'm not terribly familiar with European standards, are you using SCART or something like that?

]-Could be the Hz cycle - is there any program to fix this? I remember
]-there was a program on the ST which allowed you to do 50 or 60Hz on
]-the touch of a keystroke.

I use NVRAM to set my Falcon to NTSC or Pal, which covers 60/50hz, right? It also allows me to set my boot-up screen to 40 columns, so that disk-only games like Dungeon Master will still work, and allowing me to enjoy my normal 800 x 600 screen after the initial boot-up, if I'm not using anything floppy based... ;-)

]-Games in particular are:
]-PacThem
]-Spice

Darn the luck, I've never tried either so I'm not familiar with them. Anybody else have these games running on their Falcons with RGB and/or a TV?

I just picked up an Atari 1040ST with a mouse, power cords  and monitor
at my local thrift store. It's running GEM on the TOS operating system.
Does anyone know where I can find a FAQ or general information about
this computer? I formated a PC disk in it and the files seem DOS
compatible --does anyone know of web sites where I can download software
for this thing? Thanks for your help!

The above posting is all I could get Newsie to fetch. I never took much notice in the past when I read postings that never finished, I presumed that that was the entire message that was posted. I tried for 15 minutes to fetch more of the posting, at times I only got one line and once I got the signature and nothing else!!!

I don't know what's up with Newsie just lately; postings not being posted, eof message when accessing newsgroups after an ftp session, Y's and N's being placed on the newgroups postings line and now incomplete fetching of articles:(((

Getting a little depressing as I don't want to use a nightmare PC for mail & newsgroups; the Atari's a lot less hassle. Ah such is life!!

For a FAQ check out the URL in my .sig. It contains all you need (and more) to get started...

Good luck!

Eizo model 6500 multiscan 21 inch monitor, fst display, ecl inputs for TT hi and analog ins for graphics card, falcon, pc or mac. Beautiful image (paper white monochrome), great for DTP or midi. Max resolution is over 1600 by 1400 at 70Hz+. Condition as new, very little usage, cost a fortune.

Offers around �400.

Either you TV is so old that it can only sync on 50Hz or the games are
made for VGA only. BTW. Some new TVs can only sync on 50Hz as well, but
handles 60Hz (NTSC) through the EURO connector. My Sony does that.

Make a try with a newer version of Newsie and/or increase the timeout
delay in the options: your news server may be too slooowww

Bye,
/Pascal/

Hi

There isn't a break in the data fetched, it just ends a draw the window. As with a newer version of Newsie, I've yet to get them working properly; they lock up and/or bomb out when I edit anything using an external editor.

Hello girls and boys ...

Are there any mods that can be made to the STe audio system to 'clean it up'? I know its limited to 8-bit samples but even when idle its horrendously noisy.

Jim.

Hi all,

I have just bought a second hand copy of the Delta Labs Linux
CD v0.92 (thanks Denesh) and I am having a few problems installing
it on my Hades.

I have recently downloaded an update to the boostrapper program
which seems to have no problem running on my Hades, but when it
tries load the Linux kernel my system just hangs.

So, does anybody know where I may find a Hades compatible
Linux kernel?

Thanks all.

Regards,

Ben Hills.

The tools coming with HDDRIVER provide for DOS compatible partitions to be created and used with the Atari. Note that for DOS compatible partitions > 32 MByte either Big-DOS or MagiC is required. Without Big-DOS or MagiC the HDDRIVER tools can also create DOS compatible partitions but the partition size is then limited to 256 MByte with TOS 1.0 or 512 MByte with TOS 2.0/3.0

The demo version of HDDRIVER is available from

http://acp5.chemie.uni-kl.de/seimet/atari_english.html

Hello,

Ben Hills (ben@imperial.co.uk) wrote:

: I have just bought a second hand copy of the Delta Labs Linux
: CD v0.92 (thanks Denesh) and I am having a few problems installing
: it on my Hades.

Hmm, I didn't manage to install the old ALD on my TT, even with Roman
helping me with a few things (from Whiteline Psi-CD-ROM).
I would recommend to get the new nearby ready Debian 2 either by Delta
Labs Media (expensive) or by ftp from e.g. ftp.debian.org (the
binary-m68k-packages out of /hamm/hamm).

With these you get an uptodate Linux.

: I have recently downloaded an update to the boostrapper program
: which seems to have no problem running on my Hades, but when it
: tries load the Linux kernel my system just hangs.

Is your disk already lnx-formatted and the basis system installed?
You might have trouble with the bootstra.ttp being to modern for the old
ALD.

: So, does anybody know where I may find a Hades compatible
: Linux kernel?

A simple exchange of the kernel won't do. It will be incompatible to the
rest of the ALD.
You need a newer kernel and the newer kernels only run with ext2fs.

But you might ask the following person for advice:

Wout Klaren
<W.Klaren@inter.NL.net>.

According to Roman he is the only one running Linux run on
his Hades. He wrote the patches to make the Linux kernel work on it.

Regards,

Kerstin

All people interested in pinouts should look at:
http://margo.student.utwente.nl/stefan/hwb/menu_Connector.html

The above site has pinouts for just about any connector of any
"standard", even things like Vic20 video or SNES cartridge. Of course all
the usual atari stuff is there and so is the SCART connector.

Atari pinouts can also be found in this document:
http://www.teleport.com/~atari/STinternals.htm

I need to transfer my PC midi files to a friend's of mine Atari. Do you know how can I do it as long as the Atari does not read DOS formatted floppy-disks?
Reply here or mail me at hpascu@netsoft.ro
--
HoReA

You could use a nul modem or if your friend has a modem, call his place with a modem call.

The Atari DOES read MS-DOS floppy disks, as long as they are compatible with the drive, that is 720K for a double sided drive as fitted in most STs.

DOITF030 contains all what you need.
Take a part of DOITF030:

ROMPORT - PINOUT

Pin 1-2= +5V Power / Microfuse F2 0.5 Amps
Pin 3 = Data 14 (D14)
Pin 4 = Data 15 (D15)
Pin 5 = Data 12 (D12)
Pin 6 = Data 13 (D13)
Pin 7 = Data 10 (D10)
Pin 8 = Data 11 (D11)
Pin 9 = Data 8 (D 8)
Pin 10 = Data 9 (D 9)
Pin 11 = Data 6 (D 6)
Pin 12 = Data 7 (D 7)
Pin 13 = Data 4 (D 4)
Pin 14 = Data 5 (D 5)
Pin 15 = Data 2 (D 2)
Pin 16 = Data 3 (D 3)
Pin 17 = Data 0 (D 0)
Pin 18 = Data 1 (D 1)
Pin 19 = Adress 13 (A13)
Pin 20 = Adress 15 (A15)
Pin 21 = Adress 8 (A 8)
Pin 22 = Adress 14 (A14)
Pin 23 = Adress 7 (A 7)
Pin 24 = Adress 9 (A 9)
Pin 25 = Adress 6 (A 6)
Pin 26 = Adress 10 (A10)

Pin 27 = Adress 5 (A 5)
Pin 28 = Adress 12 (A12)
Pin 29 = Adress 11 (A11)
Pin 30 = Adress 4 (A 4)
Pin 31 = ROM-Select   3
Pin 32 = Adress 3 (A 3)
Pin 33 = ROM-Select   4
Pin 34 = Adress 2 (A 2)
Pin 35 = UpperDataStrobe (UDS)
Pin 36 = Adress 1 (A 1)
Pin 37 = LowerDataStrobe (LDS)
Pin 38-40 = GND (Ground)

The same Pinout as ANY atari with rom-port.
ANY mistake on this port costs you your machine!
Wires not longer as 10 cm. Watch for interferences.

Regards, Robert

:
: I guess you're referring to the often-told 40 % limit. This limit does not

Negative. This limit does exist in ALOHA-based networks, i.e. Carrier Sense
without Collision Detection. This limit indeed is NOT applicable to Ethernet
(did I state anywhere it is ?). So, I was not referring to that ;)

: really exist, it's a fairy tale. Even on a heavily loaded Ethernet (i.e. many :
stations) 95 % of the theoretical limit can be reached with modern networking
: hardware.

Completely true. My point was that, even if you get the maximum yield out
of Ethernet (e.g. multiple stations with 1024byte frames), much of that
traffic is meaningless to one particular receiving station. If the ST should
handle all the Ethernet-stuff like collision-handling, jams etc., then it
would be impossible to do it serial. But if your card is intelligent enough
(like all Ethernet cards today), then it should only use the serial line when
a 'useful' frame has arrived (directed to the ST or a broadcast frame).
:
:
: >: to Ethernet adaptor can't be anything but a bad kludge.
: >
: > ...but one could ask why this hasn't been done before...

Greatings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there.

www.users.globalnet.co.uk/~mega01/

Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

If you would liked to be mailed issue 2 then send you E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site in a few days.

Please contribute to MEGA and support it, else it will be one more nail in the coffin for ATARI.

All comments and suggestions are more than welcome. Please feel free to mail me at any time.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about.

Mail me at. mega01@globalnet.co.uk   Now for issue 2.

Chris Swinson.

Hello all ATARI lovers.

UFOST issue 2 now avaliable by Lee Round. UFOST is another disczine for the Atari range of computers.

UFOST is a new UFO based zine covering all UFO abductions, encounters and sightings plus a lot more.

Keep an eye on my web site for issue 2 or mail me if you cannot wait.

Please take the time to send a letter to Lee else he may not produce future issues, Currently he has almost compleated issue 3.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while yet.

Send a disc with a S+E to

Lee Round (UFOST)

The Atari ST reads both single-sided and double-sided
single-density and double-density diskettes using the
same format as IBM clone computers.

The Atari Falcon additionally reads single-sided and
double-sided HIGH density diskettes using the same
format as IBM clone computers.

Cheers!

AFAIK single density means FM format (low level format mode, usually MFM is used). The ATARI's floppy controller can read and write FM disks, but you need a little hardware modification. Besides, I never saw those.

> The Atari Falcon additionally reads single-sided and

There should be no single sided high density disks...

> the same model number.

To clarify: 'The Falcon can only supply ~1/2 ampere at 5vdc and NO 12vdc' means that a SINGLE 2.5" IDE hd will use up this 1/2 ampere and there is NOTHING left in the Falcon power supply!! In other words a Falcon with an internal 2.5" hd is totally maxed out.

Especially if you are running 14mb ram. If you try to draw any more power you will find possibly that the floppy drive does not work.

To avoid these problems use an external ps for any or all hard drives. Be sure that the ps regulates to within +/- 5% of the nominal 5v and 12v ratings. Linear ps's are perhaps better than switching ps's when only
one or two hd's are being run.

To enjoy the IDE standard of two devices (hd's) you need to use the [HD driver] driver which is produced in Germany. The Atari and ICD drivers only will operate a single hard drive. I have no experience with HDdriver since I was never able to fill up the hd's I tested (1gb

Micropolis and 850 Seagates).

So if you use an external ps you will only run pins 1 thru 40 for data to the header on the Falcon mainboard. When connecting power to any hd be *absolutely* sure of both voltage and polarity.

Don't tell my Falcon about this. I have got a AB040 with 16MB RAM and
a Super Nova Falcon in my box and it have worked just fine for a long
time now. But I do agree, the PSU is not made for this....

A quick check of Windows95 shows support only for
720K and 1.44M diskettes -- i.e., double-sided only.

Another reason to consider the Atari.

Hi everyone,

Well supplies are almost exhausted, I only have a small handful of Atari/Riebl Ethernet cards remaing with Atari ANS network drivers, I have 1, possibly 2 Atari Mega ST network cards left: $150 each

I have 4 Atari/Riebl Mega STe/TT030 VME bus ethernet cards left: $150 each

I have 6 Atari DMA MetaDOS ASCI network cards with MetaDOS drivers, these need SF354/SF314 type power supplies, do not have cases and are more suited towards hardware hackers who want to play around with these: $50 each

I Have 1 left Image Systems Atari Mega ST video card with amazing color and resolution capabilites with all drivers: $350

Thats about it, all other supplies are exhausted, sorry guys this is you last chance at these, I am taking email reserves, send me an email and I will reserve a card for you for 2 weeks until payment is received.

Curt

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site and download it from there. Also UFOST issue 1.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about everything we can think of. There should be something there for everyone.

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail
in the coffin for ATARI. Any articles are welcome, If you have idea on one why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk   Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Additional......

Due to the mass response to both issues, I may have missed a few people who have requested issues. If you have not as yet received what you have asked for then please mail me back, Sorry to all who I have missed.

Thankyou for you time :-)

I have one of the old MO401 13" Sony Trinitron Monitors from my Mac IIci...
can I use this with my newly aquired falcon?

Also, I don't have a mouse but want to poke around the OS a bit... I can
hold the alt key and use the arrow keys to move about, but I can't find any
way to activate mouse clicking. I position the cursor over an icon but
cannot activate it... any ideas?

Thanks much!
Roagggggie

The pin DDEN (Double Density ENable), pin 26, is grounded. Make it high
and it wil write in FM format.

> : There should be no single sided high density disks...
>
> Well, there _could_ be... :-)

There are. Both 3.5" and 5.25"

Sounds like Ins or whateverkeys there are in front left and right of the arrows in combination with Alt just might do the trick.

Now a little puzzle ... how to copy AND rename in TOS 4 with only the keys .... I always wondered how that is supposed to be done ;)

Yes, i know the problem..
They are all connected directly to the COMBO.
But i'm not sure what funktion they are all have.

I don't have a layout of any expansions card or from the COMBO.
Some questions for the developer of that mess.. :)
Some secrets in this box..
No answers in the manual..
Sorry

Regards, Robert

I think you mean "not rename", since Alt does rename. And it is
possible if you quickly release Alt, shortly after you release Ins.

Greetings all ATARI lovers.

Mega Disczine Issue 2 is now out, If you missed issue 1 then goto my site
and download it from there. Also UFOST issue 1.

http://www.users.globalnet.co.uk/~mega01/

MEGA Issue 2 is on 2 discs and has over 200 articles covering just about
everything we can think of. There should be something there for everyone.

Also UFOST issue 2 is available, Dedicated to UFO's abductions and sightings. Not to be missed if you are interested in this type of thing. This is produced by Lee Round.

If you would liked to be mailed issue 2 of either disczine then send your E-mail address and request it. I will then Mail it to you. Or you can wait until it is uploaded onto my site.

Please contribute to MEGA & UFOST and support it, else it will be one more nail
in the coffin for ATARI. Any articles are welcome, If you have idea on one why not mail me and tell me about it.

All comments and suggestions are more than welcome. Please feel free to mail me at any time. Any support you can give is gratefully received.

Tell me a little about yourself, It will help me in producing MEGA if I get some idea on what people like to read about. Don't hide behind you keyboard, let the world hear you...

Mail me at. mega01@globalnet.co.uk Now for issues.

Please take the time to send a letter to Lee Round (UFOST) else he may not produce future issues, Currently he has almost completed issue 3. Please take time to send him a article or 2, A blank disc is not very encouraging.

If you want issue 3 then send a letter to Lee (not on the net as yet) and request it from him. Issue 3 will be uploaded onto my site, but not for a while.

Send a disc with a S+E to

Lee Round (UFOST)
23 Fellrose Court,
Pelton Fell,
Ch-Le-Str,
Co Durham,
England,
DH2 2QB.

Tell him that I sent you (Chris Swinson).

Additional......

Due to the mass response to both issues, I may have missed a few people who have requested issues. If you have not as yet received what you have asked for then please mail me back, Sorry to all who I have missed.

Thankyou for you time :-)

Hi everyone!

I am trying to transfer lots of files from a Falcon's hard drive to a Mac. I taught of using Syquest cartridges formatted in DOS but the Atari doesn't recognise them.

Any ideas on how to do that (apart of making a null-modem cable)?

Thanx for your attention ;-)

Hi Robert!

I am not sure thee last copy of this went out as I didn't repeat the addressing in the body of the message, so I am repeating it:

Is there much new in V6.0.2. over the 16 Jan 98 version? I don't want to download 5 Megs+ needlessly! :-) (Perhaps you could make an update or patch available for those that have earlier versions?)

NEW: Also, any chance of splitting these files up into sections that will fit on HD floppies, say? A friend downloads them from me at work and wants to put them straight onto floppy, not the firm's hard drive --and has no easy way to split them on a PC anyway... :-(

Regards
/Peter/

I just had the same problem with ZIP disks and transfer to Mac and PC's. The solution is getting MagiC 5 or using BigDOS to be able to access PC cartridges/disks larger than 32Mb. The problem you get is that BigDOS won't run with all HD drivers ;) I tried out CBHD 5.02 at first, then I got HDDriver 7.0, and I still get garbage from PC disks a little now and then. Once STZip even trashed a Zip-disk due to some writes. But in MagiC 5 everything runs just fine!

BUT! If you want a quick solution, do you have an MS-DOS PC-compatible HD driver? I had HuSHI from the beginning, and you could format a drive and partition it to several partitions less than 32Mb large. It's however annoying to have a lot of small partitions, but it works with both PC (at least the first partition is readable) and with Mac. And this way you don't need to figure out all the german doc's :)

Allright! That's indeed what I meant ... and how long has it taken for me to
get that little piece of information? Some three or four years perhaps? ;)
And I even used to develop on Falcon, Gee I'm ashamed of myself. I will now
format some of my best disks of nasty pictures as it seems like a reasonable
punishment for a mistake as big as this ;)

Anyone know where this norweigan man has gone? He had some awesome "How to
clock the Falcon DSP to 50MHz" and "Falcon030 FPU Accelleration" DIY
projects ... but his pages aren' t up any longer, and I never saved his
info. Anyone have these descriptions? Or know where he is?

Regards, K�re Hampf

You better get your self a 68000 and 030 manual and start reading! :-)
The expansion port is basicly a 68000 cpu bus with a few more oddities.

FC2 -   are just the regular Function Codes (030 compatible in this case)
        used with 68k CPUs.

Bmode - decides which timing to use, 68030 or 68000. If low you use
        68030 timing if high 68000 (which edge of CPUCLK to sample
        AS on). You can _only_ change state of this when you own the
        bus. This is only needed if you want to act as a bus master.

Expand - Only used if your device needs more than 4 cycles of decoding
         (DTACK is not generated fast enough). This is a open collector
         signal. If you can do it in less than 4 clock cycles it makes
         life esier.

You should also not have more than one TTL load on any signal.
The address space for the expansion port is located at:
F10000 - F9FFFF, a wopping 576 kbytes! ;-)

```
So what are you going to do?

You can also release Alt before you release Ins, much easier.

I know that Sun Stations are tricky on what sector size a SCSI cd rom have. This can be altered via various settings on some CD-ROM drives. Could this be the reason for your problems too? A Apple CD-ROM have to be modifyed to be used on a Sun AFAIK, dunno if it applies to an ST as well.

Regards.

> attached.

The Am 76c960/961 chip is a one chip solution for a Ethernet card. There is a application note for how to interface it to a mc68k from AMD. That ought to be possible to do something with such a chip. It costs around 22USD in low quantity so a card with it should be possible to mfg at a fairly low price.

That "only" leaves us to the problems with drivers, but that's the problem with all ethernet adapters for the ST/STe/TT/Falcon.

Just my 2 cents..

Regards.

Try mail him at: Geir.Validalo@softnet.no

I got a mail from him yestrday so he is alive.
